

MET's Institute of Engineering

Bhujbal Knowledge City, Adgaon, Nashik.

Department of Computer Engineering

“Web Essentials and Mark-up language- HTML”

Prepared By

Prof. Anand N. Gharu

(Assistant Professor)

Computer Dept.

CLASS : TE COMPUTER 2019

22 Jan 2023

SUBJECT : WT (SEM-II)

Note: The material to prepare this presentation has been taken from internet and are generated only

UNIT : I

for students reference and not for commercial use.

Syllabus

The Internet, basic internet protocols, the world wide web, HTTP Request message, HTTP response message, web clients, web servers. HTML: Introduction, history and versions. HTML elements: headings, paragraphs, line break, colors and fonts, links, frames, lists, tables, images and forms, Difference between HTML and HTML5. CSS: Introduction to Style Sheet, CSS features, CSS core syntax, Style sheets and HTML, Style rule cascading and inheritance, text properties. Bootstrap.

Outline

The Internet, basic internet protocols, the world wide web, HTTP Request message, HTTP response message, web clients, web servers

HTML: structure of html document, HTML elements: headings, paragraphs, line break, colors & fonts, links, frames, lists, tables, images and forms,

Difference between HTML and HTML5.

CSS: Introduction to Style Sheet, Inserting CSS in an HTML page, CSS selectors,

XML: Introduction to XML, XML key component, Transforming XML into XSLT,

DTD: Schema, elements, attributes,

Introduction to Bootstrap

MR. A. N. GHARU

WEB TECHNOLOGY

Web Technology

- The methods by which computers communicate with each other through the use of markup languages and multimedia packages is known as **web technology**.

Web Technologies

- HTML
- XHTML
- CSS
- XML
- JavaScript
- VBSCRIPT
- DOM
- DHTML
- AJAX
- E4X
- WMLScript
- SQL
- ASP
- ADO
- PHP
- .NET
- SMIL
- SVG
- FLASH
- Java applets
- Java servlets
- Java Server Page

List of Technologies

Client Side Technologies

- HTML, CSS, JavaScript, VBScript
- XHTML, DHTML, WML, AJAX
- FLASH

Server Side Technologies

- ASP, PHP, Perl, JSP, Servlets
- ASP.NET, Java
- MySQL, SQL Server, Access

Advanced Technologies

- XML, XSLT, RSS, Atom
- X-Path, XQuery, WSDL
- Ruby on Rails, GRAIL Framework
- REST, SOAP

Frameworks

- EmberJS
- AngularJS
- ReactJS
- BackboneJS
- VueJS

Frameworks

- ExpressJS
- Django
- laravel
- NodeJS

Internet and WWW

- Inter-network and World Wide Web
- Interlinked hypertext documents accessed using HTTP Protocol
- Client - Server architecture

What is Internet?

- The Internet is essentially a global network of computing resources. You can think of the Internet as a physical collection of routers and circuits as a set of shared resources.

Internet-Based Services

- **Email** – A fast, easy, and inexpensive way to communicate with other Internet users around the world.
- **Telnet** – Allows a user to log into a remote computer as though it were a local system.
- **FTP** – Allows a user to transfer virtually every kind of file that can be stored on a computer from one Internet-connected computer to another.
- **UseNet news** – A distributed bulletin board that offers a combination news and discussion service on thousands of topics.
- **World Wide Web (WWW)** – A hypertext interface to Internet information resources.

What is WWW?

- WWW stands for **World Wide Web**.
- A technical definition of the World Wide Web is – All the resources and users on the Internet that are using the Hypertext Transfer Protocol (HTTP).
- In simple terms, The World Wide Web is a way of exchanging information between computers on the Internet

What is HTTP?

- HTTP stands for **H**ypertext **T**ransfer **P**rotocol. This is the protocol being used to transfer hypertext documents that makes the World Wide Web possible.
- A standard web address such as **Google.com** is called a URL and here the prefix **http** indicates its protocol

What is URL?

- URL stands for **Uniform Resource Locator**, and is used to specify addresses on the World Wide Web.
- A URL will have the following format—
 - **protocol://hostname/other_information**
- The protocol is followed by a colon, two slashes, and then the domain name. The domain name is the computer on which the resource is located.

What is Website?

- which is a collection of various pages written in HTML markup language.
- Each page available on the website is called a *web page* and first page of any website is called *home page* for that site.

What is WebServer?

- Every Website sites on a computer known as a Web server.
- This server is always connected to the internet.
- Every Web server that is connected to the Internet is given a unique address. For example, 68.178.157.132
- When you register a Web address, also known as a domain name, such as tutorialspoint.com you have to specify the IP address of the Web server that will host the site.
- **Examples of Web Servers**
 - Apache Tomcat
 - IIS
 - Glassfish

What is Web Browser?

- Web Browsers are software installed on your PC. To access the Web you need a web browsers.
- **Examples of Web Browsers**
 - Netscape Navigator,
 - Microsoft Internet Explorer
 - Mozilla Firefox.

What is ISP?

- ISP stands for **I**nternet **S**ervice **P**rovider. They are the companies who provide you service in terms of internet connection to connect to the internet.
- You will buy space on a Web Server from any Internet Service Provider. This space will be used to host your Website.
- **Examples of ISP Providers**
 - Reliance
 - Airtel
 - BSNL

List of Technologies

- **Client Side Technologies**
 - HTML, CSS, JavaScript, VBScript
 - XHTML, DHTML, WML, AJAX
 - FLASH
- **Server Side Technologies**
 - ASP, PHP, Perl, JSP
 - ASPNET, Java
 - MySQL, SQLServer, Access
- **Some More Advanced Technologies**
 - XML, XSLTRSS, Atom
 - X-Path, XQuery, WSDL
 - XML-DOM, RDF
 - Ruby on Rails, GRAIL Framework
 - REST, SOAP

How to choose a Technology?

- **Depends on:**
 - What is the type of content?
 - Who is your audience?
 - Who will modify your content?
 - What are your Future Plans?
 - Availability of technology?
 - Your previous experience?
 - Portability and Data sharing

What is HTML?

- HTML stands for **H**yper **T**ext **M**arkup **L**anguage.
- This is the language in which we write web pages for any Website.
- This is a subset of Standard Generalized Mark-Up Language (SGML) for electronic publishing, the specific standard used for the World Wide Web.

What is Hyperlink?

- A hyperlink or simply a link is a selectable element in an electronic document that serves as an access point to other electronic resources.
- Typically, you click the hyperlink to access the linked resource.
- Familiar hyperlinks include buttons, icons, image maps, and clickable text links.

Web - Domain Names & Extension Types

- A domain name is the part of your Internet address that comes after "www". For example, in TutorialsPoint.com the domain name is tutorialsPoint.com.
- Some Domain Extensions are as mentioned below
 - **.com** – Stands for company/commercial, but it can be used for any website.
 - **.net** – Stands for network and is usually used for a network of sites.
 - **.org** – Stands for organization and is supposed to be for non-profit bodies.
 - **.us, .in** – They are based on your country names so that you can go for country specific domain extensions
 - **.biz** – Answer extension on the Internet and can be used to indicate that this site is purely related to business.

Website Designing steps

- Information Gathering
- Planning
- Design
- Development
- Testing and Delivery
- Maintenance

Website Planning

- Set goals and objectives.
- Create a budget
- Define roles and responsibilities.
- Create content strategy
- Structure your website
- Create mock-up
- Start designing
- Test it out
- Maintain your website

Website Design Issues

- Simplicity – less animations, texts, visuals
- Identity – web apps through design
- Consistency – e.g. uniform style, color, etc.
- Robustness – required function should not miss
- Navigability – navigation should be simple
- Visual appeal - look & feel of content
- Compatibility – compatible to all browsers, internet connection types, OS, etc.

Protocol

- ❑ Protocol set of standard rules that allows different types of computers to communicate with each other.
- ❑ The IP protocol ensures that each computer that is connected to the Internet is having a specific serial number called the IP address

Internet Protocols

- **SMTP(Simple Mail Transfer Protocol)**
- **PPP(Point to Point Protocol)**
- **FTP (File Transfer Protocol)**
- **SFTP(Secure File Transfer Protocol)**
- **HTTP(Hypertext Transfer Protocol)**
- **HTTPS(Hypertext Transfer Protocol Secure)**
- **TELNET(Terminal Network)**
- **POP3(Post Office Protocol)**

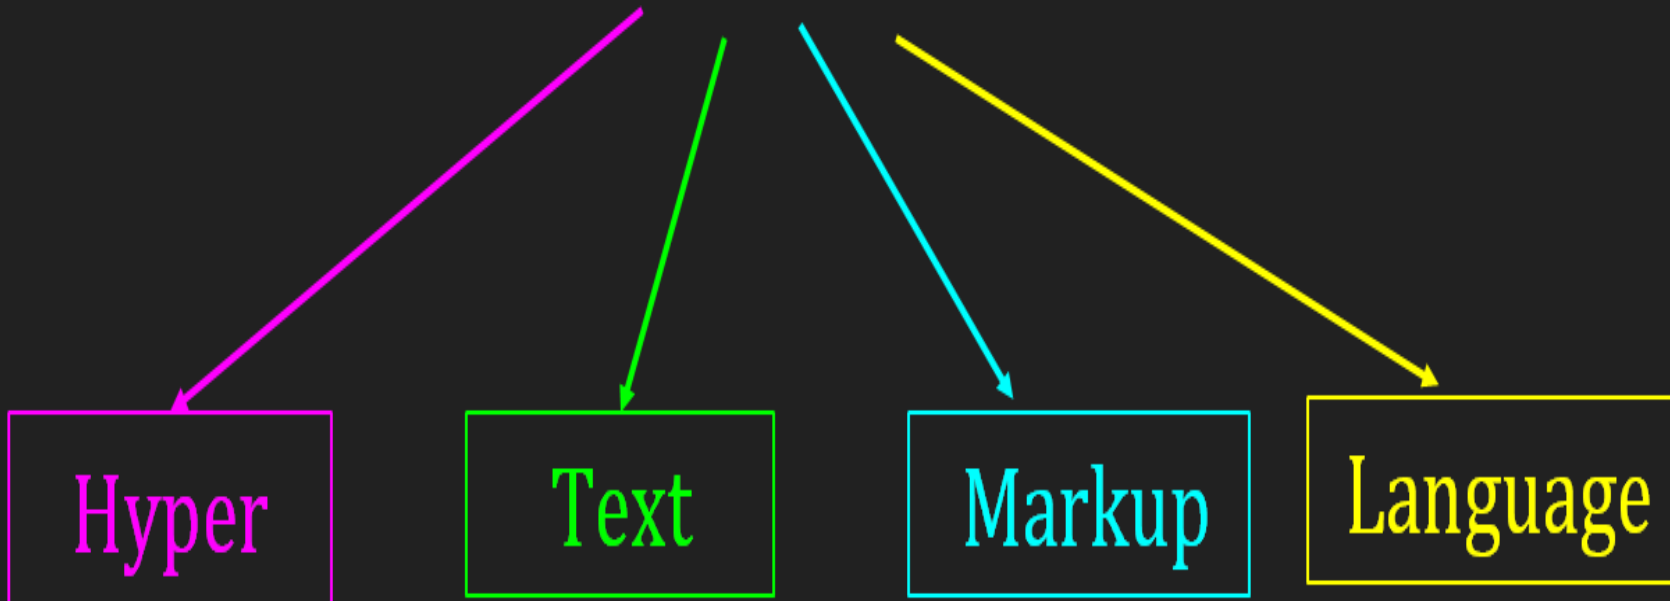

WWW- World Wide Web

World Wide Web, which is also known as a Web, is a collection of websites or web pages stored in web servers and connected to local computers through the internet

HTML

HTML

HTTP Protocol

- ❑ HTTP is a TCP/IP based communication protocol
- ❑ HTTP is used to deliver data (HTML files, image files, query results, etc.) on the World Wide Web.
- ❑ This is an Application Layer protocol.
- ❑ The default port is TCP 80

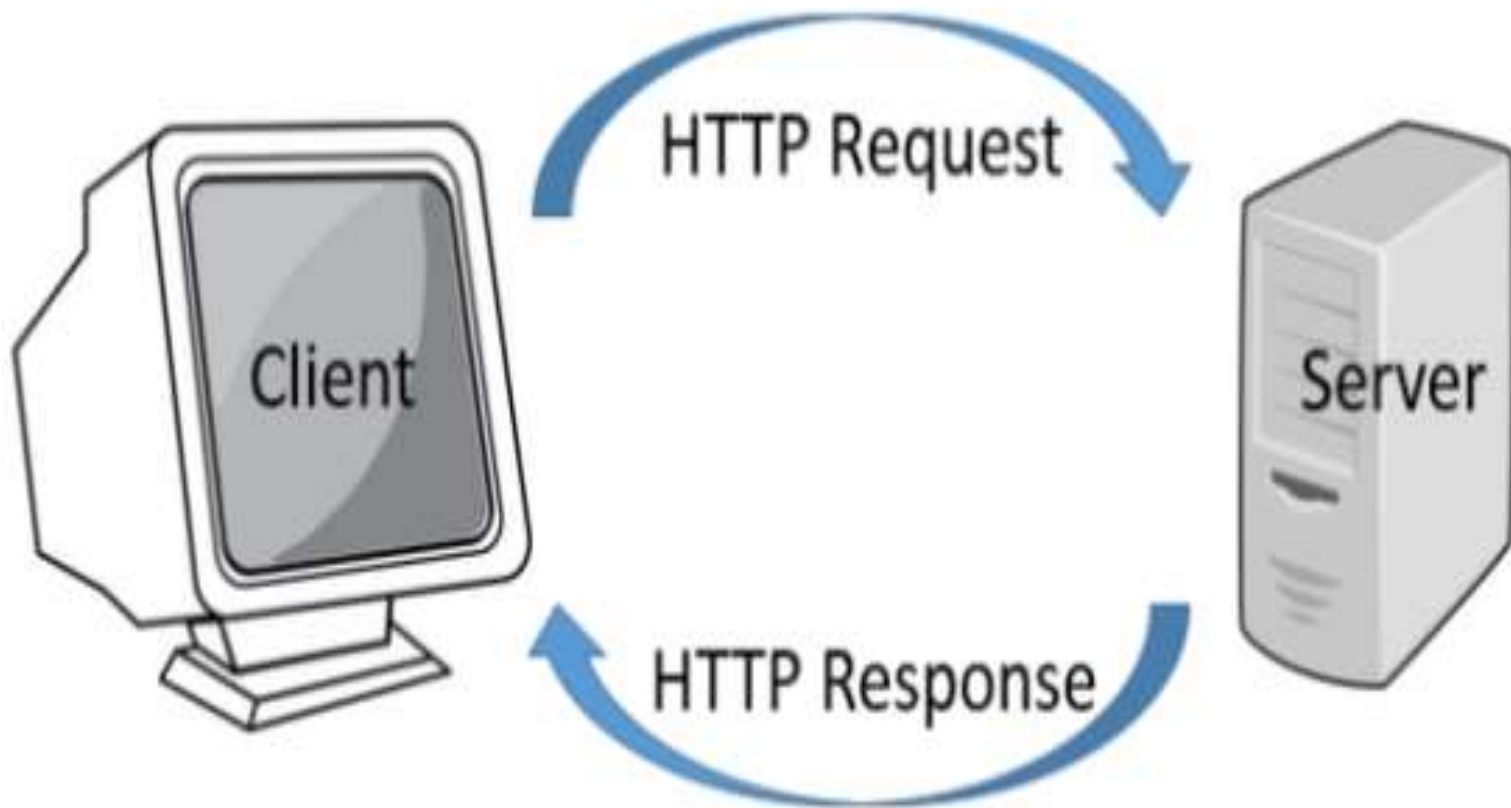

Web and HTTP

- ❑ Web page consists of objects
- ❑ Object can be HTML file, JPEG image, Java applet, audio file,...
- ❑ Web page consists of base HTML-file which includes several referenced objects
- ❑ Each object is addressable by a URL

Example URL:

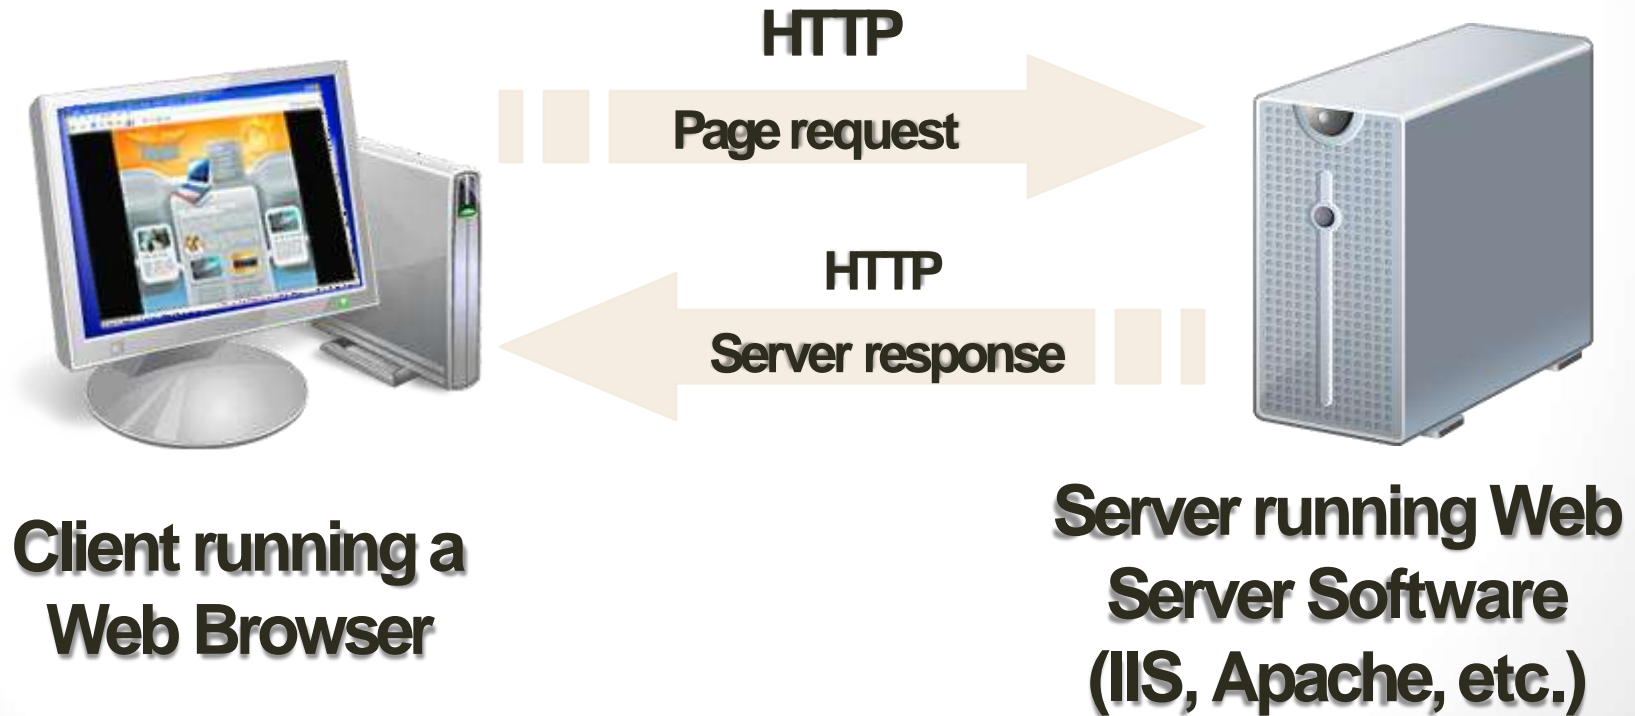

HTTP Protocol Model

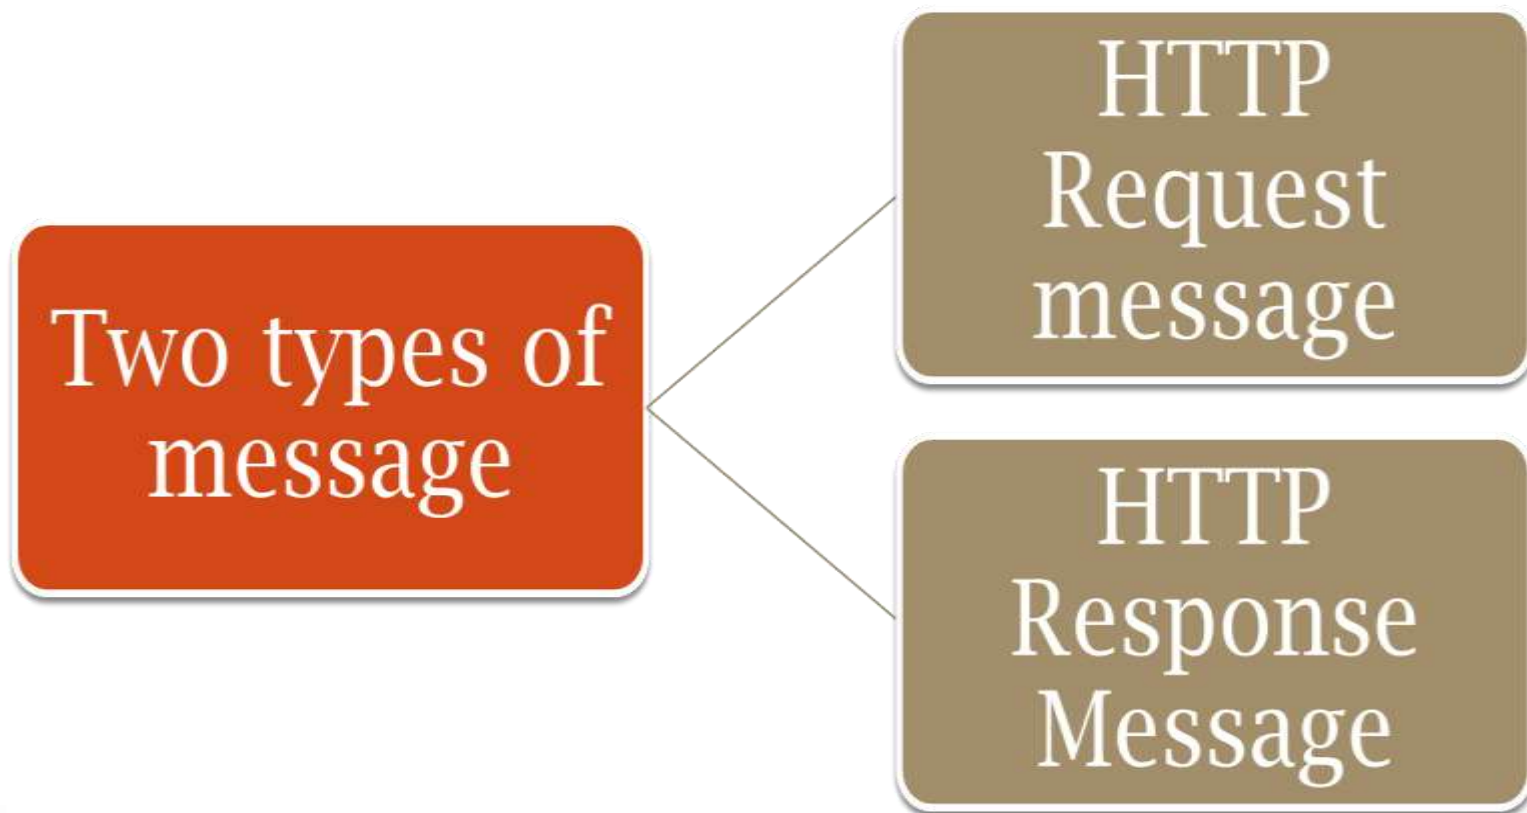

How the Web Works?

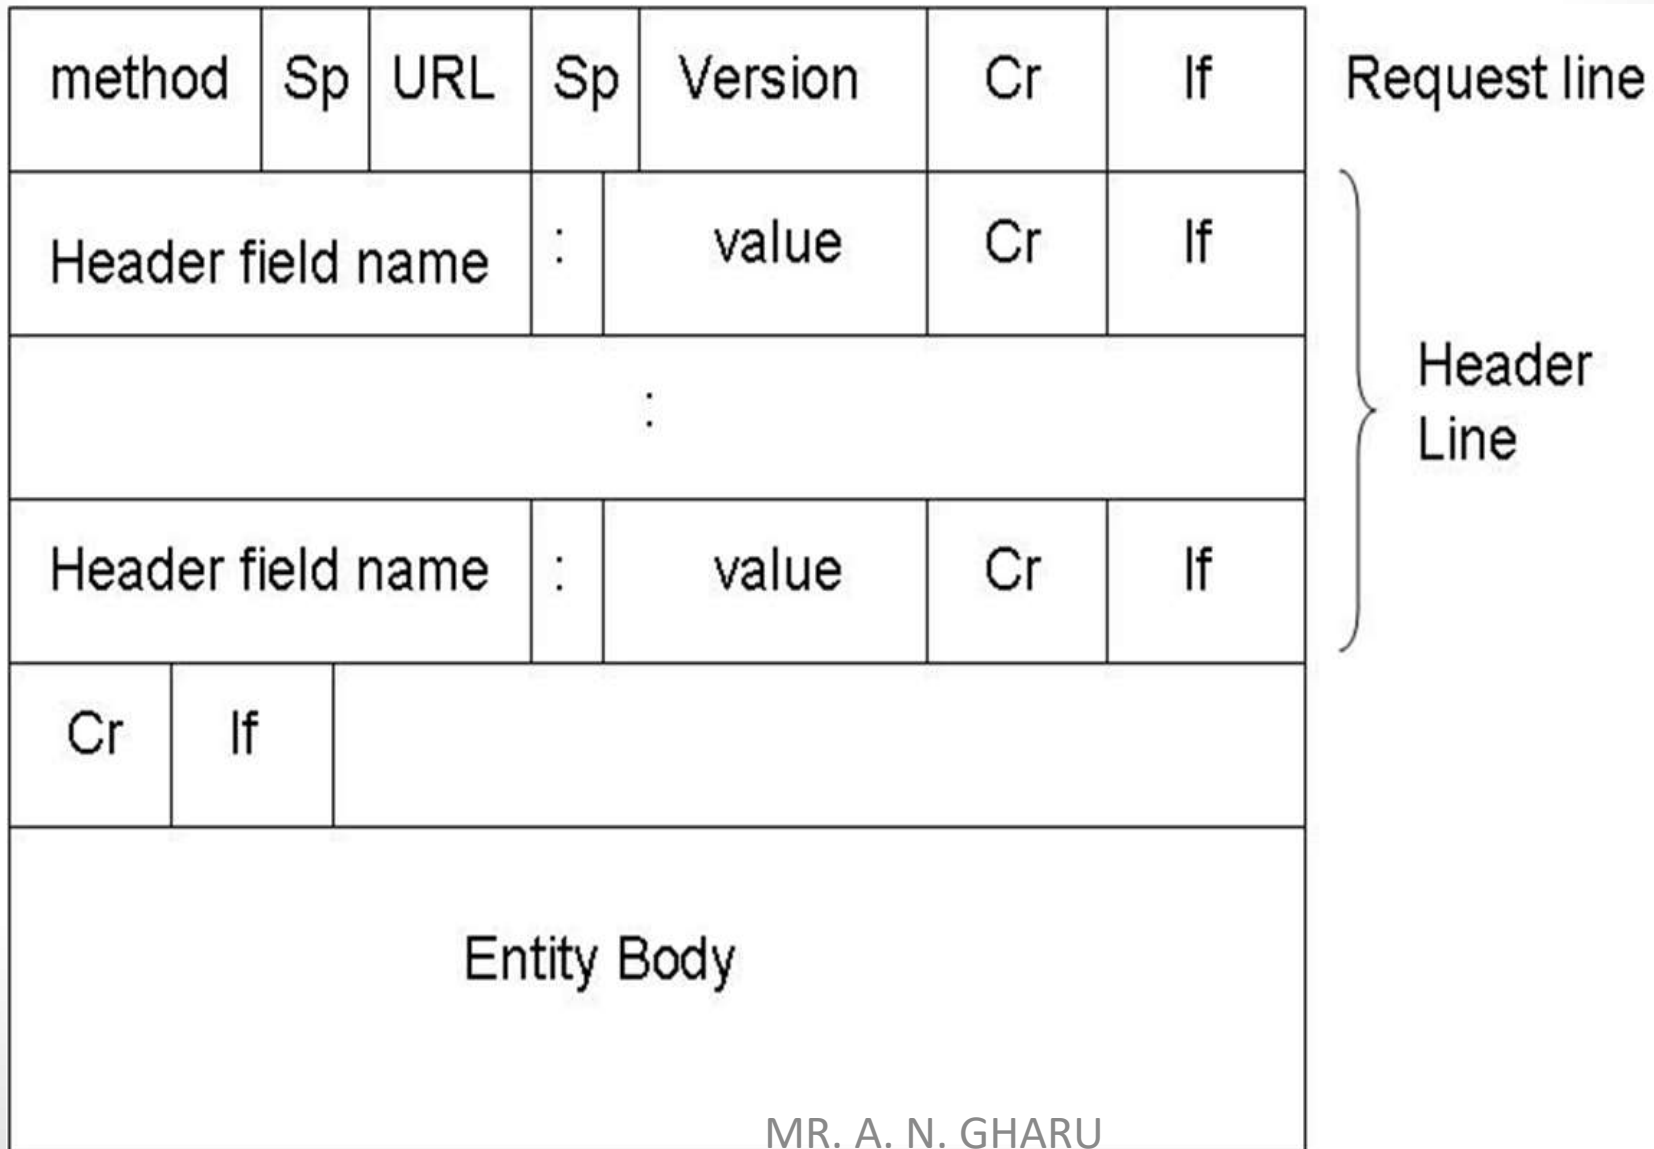

- WWW use classical client / server architecture
 - HTTP is text-based request-response protocol

HTTP Request and Response Message

HTTP Request Message

HTTP request message Example

request line
(GET, POST,
HEAD commands)

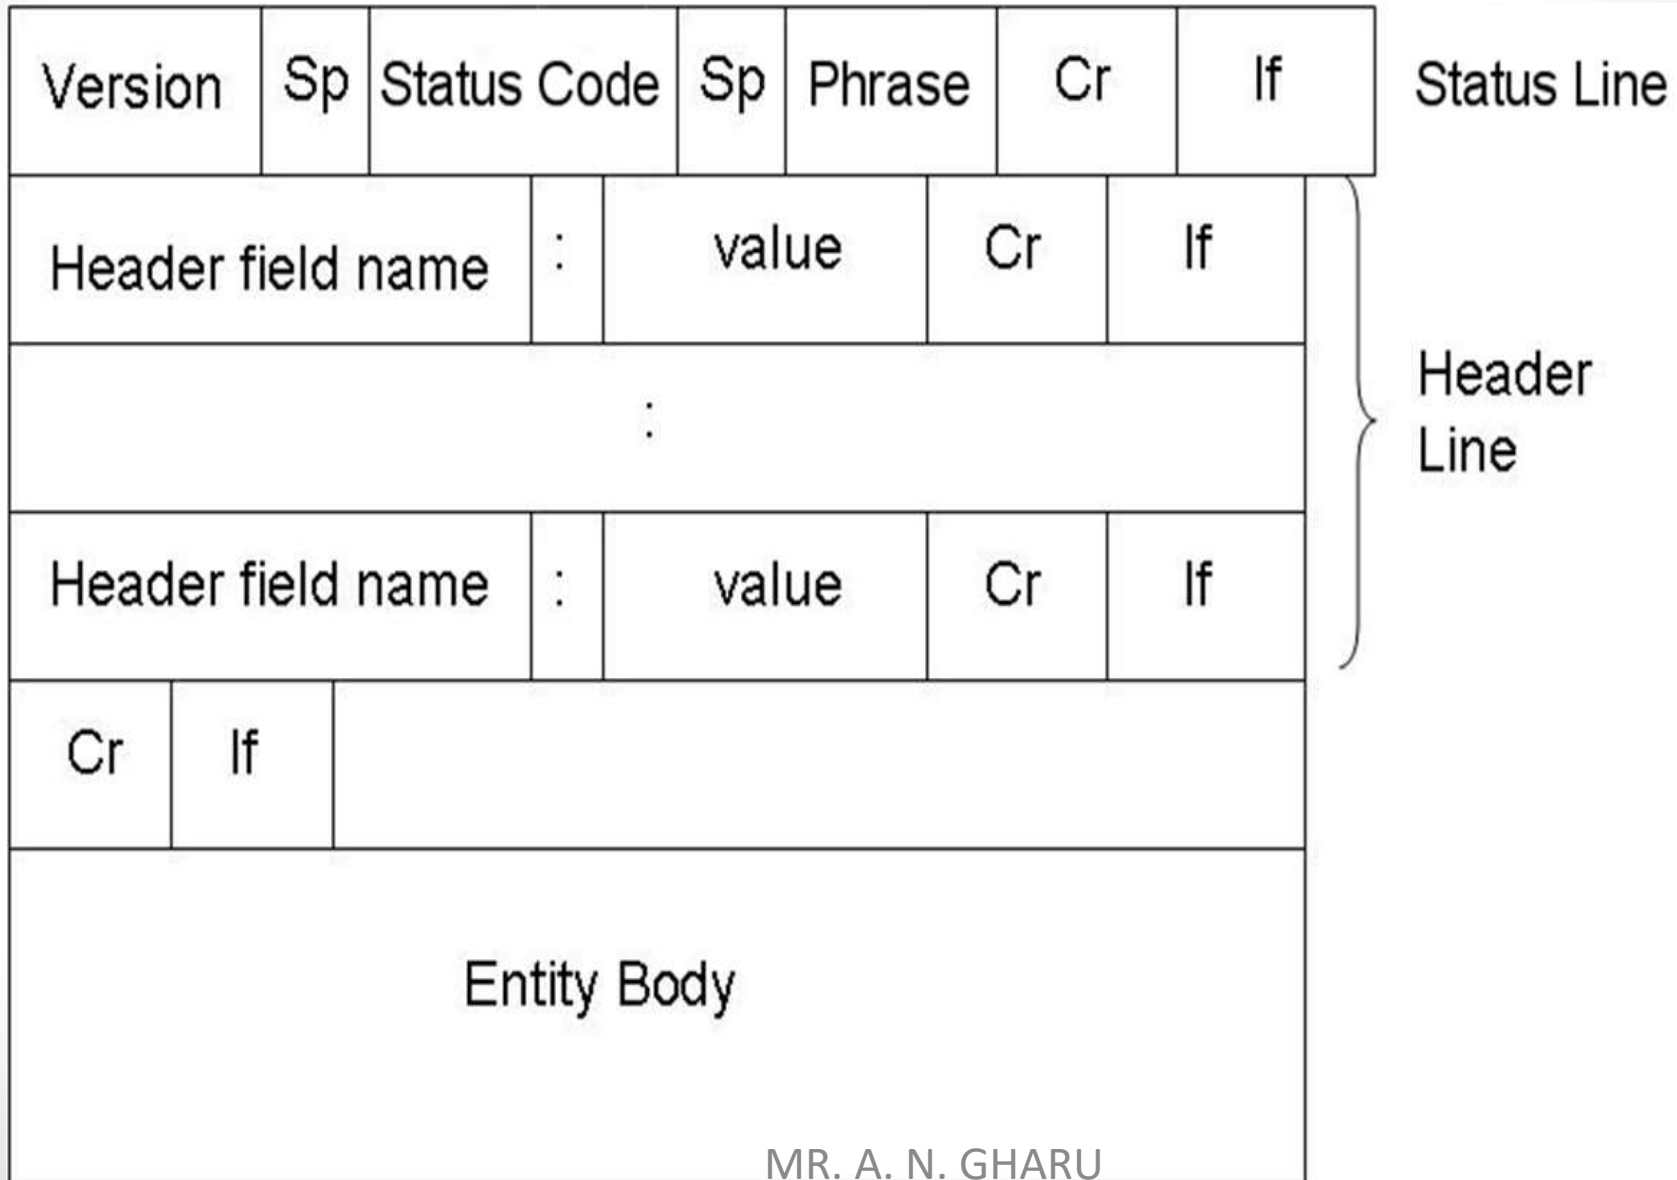

header
lines

Carriage return,
line feed
indicates end
of message

```
GET /somedir/page.html HTTP/1.1
Host: www.someschool.edu
User-agent: Mozilla/4.0
Connection: close
Accept-language: fr
```

(extra carriage return, line feed)

HTTP Response Message

HTTP response message example

status line
(protocol
status code
status phrase)

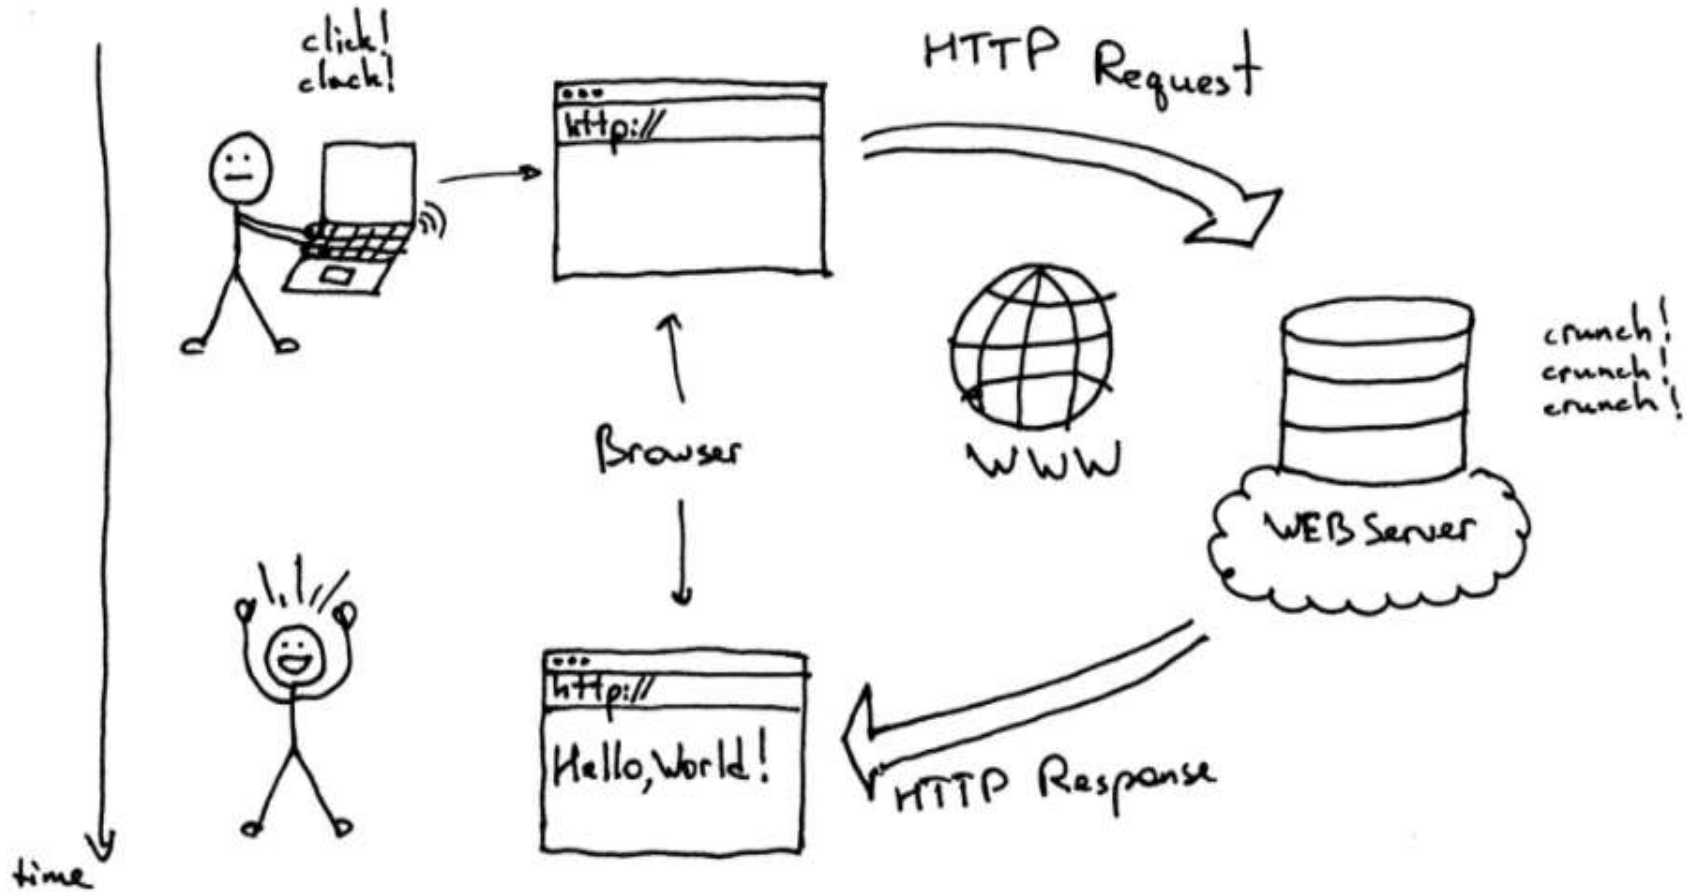

header
lines

data, e.g.,
requested
HTML file

```
HTTP/1.1 200 OK
Connection close
Date: Thu, 06 Aug 1998 12:00:15 GMT
Server: Apache/1.3.0 (Unix)
Last-Modified: Mon, 22 Jun 1998 ....
Content-Length: 6821
Content-Type: text/html

data data data data data ...
```

Web Client and Web Server

Outline

Introduction to web technology, internet and www, Web site planning and design issues,

HTML: structure of html document,HTML elements:headings, paragraphs, line break, colors & fonts, links, frames, lists, tables, images and forms,

Difference between HTML and HTML5.

CSS:Introduction to Style Sheet,Inserting CSS in an HTML page, CSS selectors,

XML: Introduction to XML, XML key component,Transforming XML into XSLT,

DTD: Schema, elements, attributes,

Introduction to JSON.

MR. A. N. GHARU

BASIC OF HTML

```
1 <!DOCTYPE HTML PUBLIC "-//W3C//DTD
2 "http://www.w3.org/TR/html4/str1
3 <html>
4 <head>
5   <title>Example</title>
6   <link rel="stylesheet" href="s
7 </head>
8 <body>
9   <div id="header">
10    <h1><a href="." title="Back
11    </div>
12   <div id="toolbar">
13    <span class="left">Today <sp
14    <span class="right">
15    <span id="time"><input type="text" value="" />
16    <select id="timezone">
17      <option value="-12"> (GMT
18      <option value="-11"> (GMT
```

HTML Basics

HTML Basics

Text, Images, Tables, Forms

MR. A. N. GHARU

What is HTML?

- HTML is the standard markup language for creating Web pages.
- HTML stands for **Hyper Text Markup Language**
- HTML **describes the structure of Web pages** using markup
- HTML elements are the building blocks of HTML pages
- HTML elements are represented by **tags**
- Browsers do not display the HTML tags, but use them to render the content of the page

A Simple HTML Document

Example

```
<html>
<head>
<title>Page Title</title>
</head>
<body>

<h1>My First Heading</h1>
<p>My first paragraph.</p>

</body>
</html>
```

Explanation

- The **<html>** element is the root element of an HTML page
- The **<head>** element contains meta information about the document
- The **<title>** element specifies a title for the document
- The **<body>** element contains the visible page content
- The **<h1>** element defines a large heading
- The **<p>** element defines a paragraph

HTML Tags

- HTML tags are element names **surrounded by angle brackets**:
- `<tagname>content goes here...</tagname>`
- HTML tags normally come **in pairs** like `<p>` and `</p>`
- The first tag in a pair is the **start tag**, the second tag is the **end tag**
- The **end tag** is written like the start tag, but with a **forward slash** inserted before the tag name

HTML Page Structure

```
<html>
```

```
<head>
```

```
<title>Page title</title>
```

```
</head>
```

```
<body>
```

```
<h1>This is a heading</h1>
```

```
<p>This is a paragraph.</p>
```

```
<p>This is another paragraph.</p>
```

```
</body>
```

```
</html>
```

HTML Versions

Version	Year
HTML	1991
HTML 2.0	1995
HTML 3.2	1997
HTML 4.01	1999
XHTML	2000
HTML5	2014 (or till date)

Creating HTML Page

Write HTML Using **Notepad or TextEdit**

Save the file on your computer using **.html or .htm extension** and set the encoding to UTF-8

View the HTML Page in Your **Browser**

First HTML Page

test.html

```
<!DOCTYPE HTML>
<html>
  <head>
    <title>My First HTML Page</title>
  </head>
  <body>
    <p>This is some text...</p>
  </body>
</html>
```

First HTML Page: Tags

```
<!DOCTYPE HTML >
<html>
  <head>
    <title>My First HTML Page</title>
  </head>
  <body>
    <p>This is some text...</p>
  </body>
</html>
```

Opening tag

Closing tag

An HTML element consists of an opening tag, a closing tag and the content inside.

First HTML Page: Header

HTML header

```
<!DOCTYPE HTML>
```

```
<html>
```

```
<head>
```

```
<title>My First HTML Page</title>
```

```
</head>
```

```
<body>
```

```
<p>This is some text...</p>
```

```
</body>
```

```
</html>
```

First HTML Page: Body

```
<!DOCTYPE HTML>  
<html>  
  <head>  
    <title>My First HTML Page</title>  
  </head>  
  <body>  
    <p>This is some text...</p>  
  </body>  
</html>
```

HTML body

HTML Headings-

HTML headings are defined with the `<h1>` to `<h6>` tags. `<h1>` defines the most important heading. `<h6>` defines the least important heading:

HTML Code

```
<!DOCTYPE html>
<html>
<body>

<h1>This is heading 1</h1>
<h2>This is heading 2</h2>
<h3>This is heading 3</h3>
<h4>This is heading 4</h4>
<h5>This is heading 5</h5>
<h6>This is heading 6</h6>

</body>
</html>
```

Output

This is heading 1

This is heading 2

This is heading 3

This is heading 4

This is heading 5

This is heading 6

Headings and Paragraphs

- Heading Tags (h1 – h6)

```
<h1>Heading 1</h1>  
<h2>Sub heading 2</h2>  
<h3>Sub heading 3</h3>
```

- Paragraph Tags

```
<p>This is my first paragraph</p>  
<p>This is my second paragraph</p>
```

- Sections: `div` and `span`

```
<div style="background: skyblue;">  
  This is a div</div>
```

Text Formatting

- Text formatting tags modify the text between the opening tag and the closing tag
 - Ex. `Hello` makes “Hello” bold

<code></code>	bold
<code><i></i></code>	<i>italicized</i>
<code><u></u></code>	<u>underlined</u>
<code><sup></sup></code>	Sample ^{superscript}
<code><sub></sub></code>	Sample _{subscript}
<code></code>	strong
<code></code>	<i>emphasized</i>
<code><pre></pre></code>	Preformatted text
<code><blockquote></blockquote></code>	Quoted text block
<code></code>	Deleted text – strike through

Text Formatting Example

HTML Code

```
<!DOCTYPE html>
<html>
<body>
|<b>This text is bold.</b>
<br/>
<i>This text is Italic.</i>
<br/>
<strong>This text is strong</strong>
<br/>
This is <sup>superscripted</sup> text.
</body>
</html>
```

Output

This text is bold.
This text is Italic.
This text is strong
This is ^{superscripted} text.

Hyperlinks: <a> Tag

- Link to a document called `form.html` on the same server in the same directory:

```
<a href="form.html">Fill Our Form</a>
```

- Link to a document called `parent.html` on the same server in the parent directory:

```
<a href="../parent.html">Parent</a>
```

- Link to a document called `cat.html` on the same server in the subdirectory `stuff`:

```
<a href="stuff/cat.html">Catalog</a>
```

- Link to an external Web site:

```
<a href="http://www.devbg.org" target="_blank">BASD</a>
```

Links to the Same Document - Example

links-to-same-document.html

```
<h1>Table of Contents</h1>

<p><a href="#section1">Introduction</a><br />
<a href="#section2">Some background</A><br />
<a href="#section2.1">Project History</a><br />
...the rest of the table of contents...

<!-- The document text follows here -->

<h2 id="section1">Introduction</h2>
... Section 1 follows here ...
<h2 id="section2">Some background</h2>
... Section 2 follows here ...
<h3 id="section2.1">Project History</h3>
... Section 2.1 follows here ...
```

Images: tag

- Inserting an image with tag:

```

```

- Image attributes:

src	Location of image file (relative or absolute)
alt	Substitute text for display (e.g. in text mode)
height	Number of pixels of the height
width	Number of pixels of the width
border	Size of border, 0 for no border

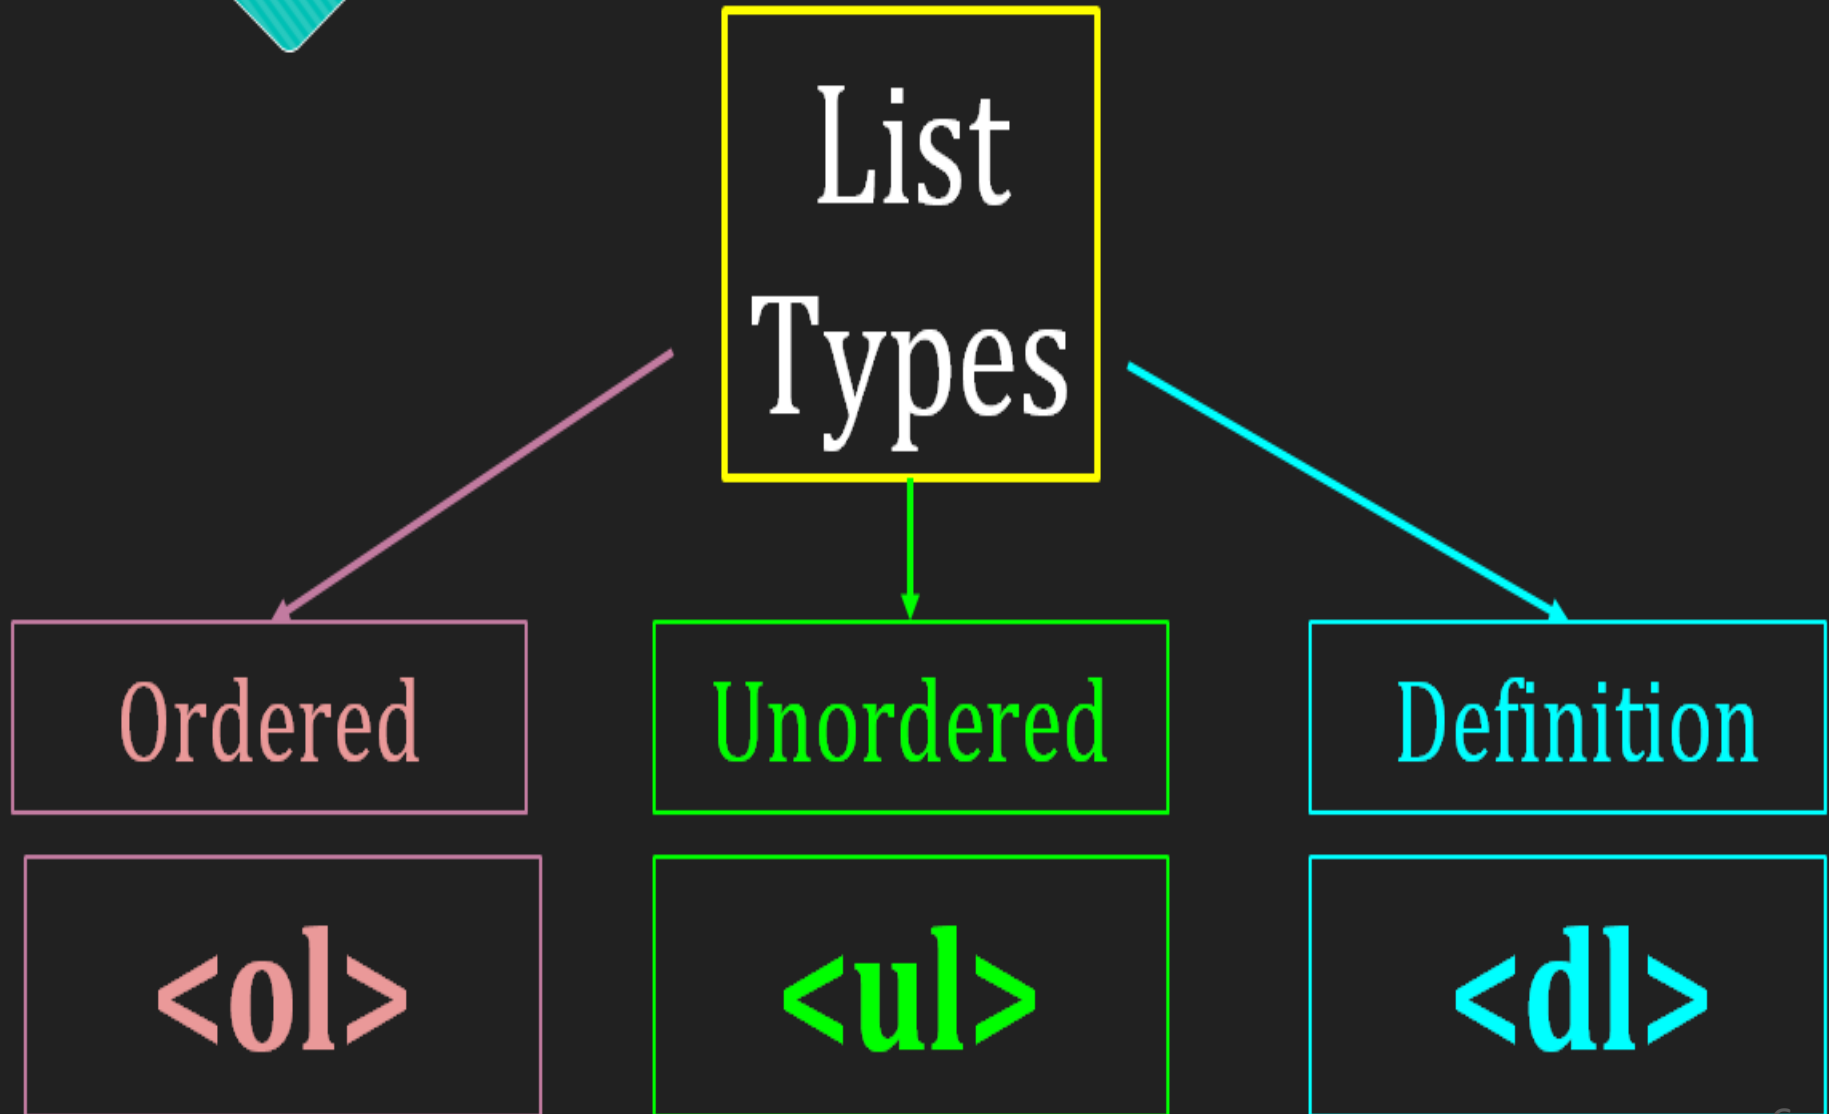

- Example:

```

```

LIST TAGS

TYPES OF LIST

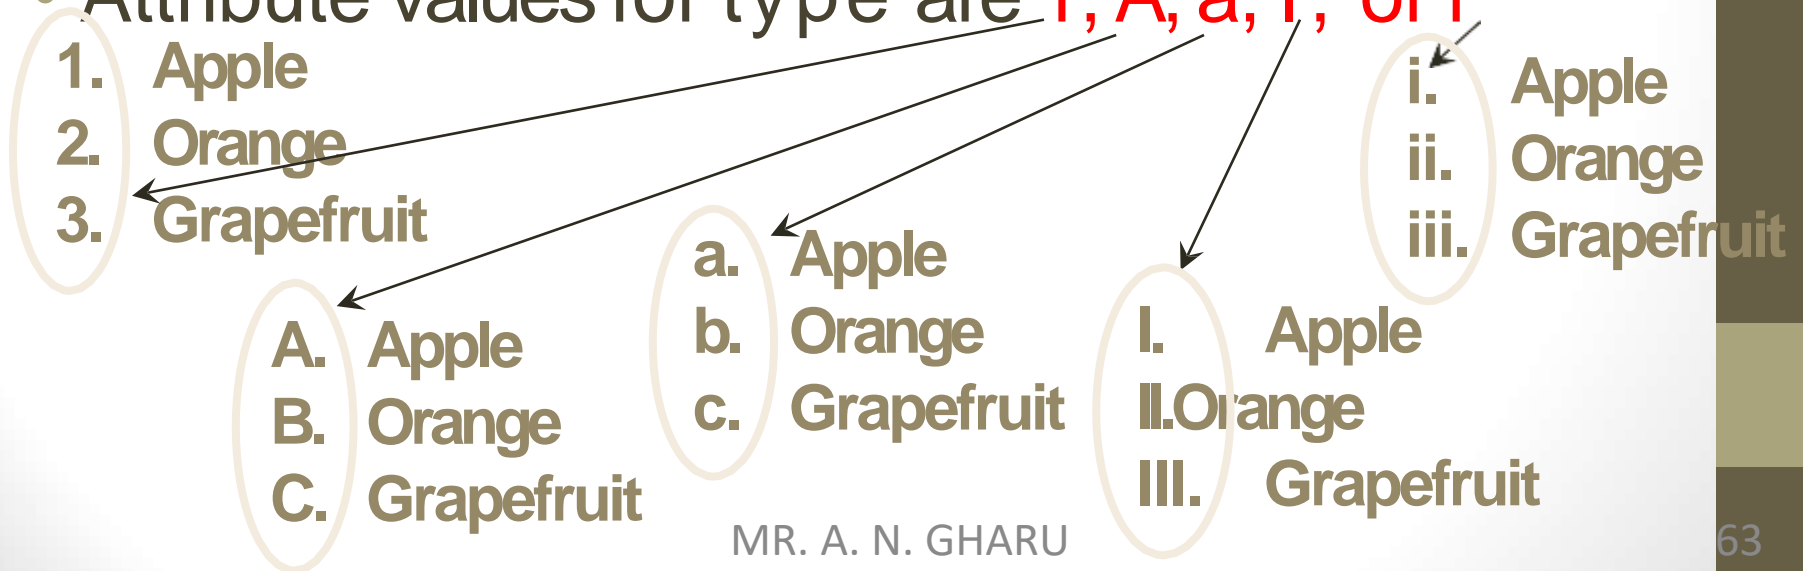

Ordered Lists: Tag

- Create an **O**rdered **L**ist using :

```
<ol type="1" >  
  <li>Apple</li>  
  <li>Orange</li>  
  <li>Grapefruit</li>  
</ol>
```

- Attribute values for type are **1, A, a, I, or i**

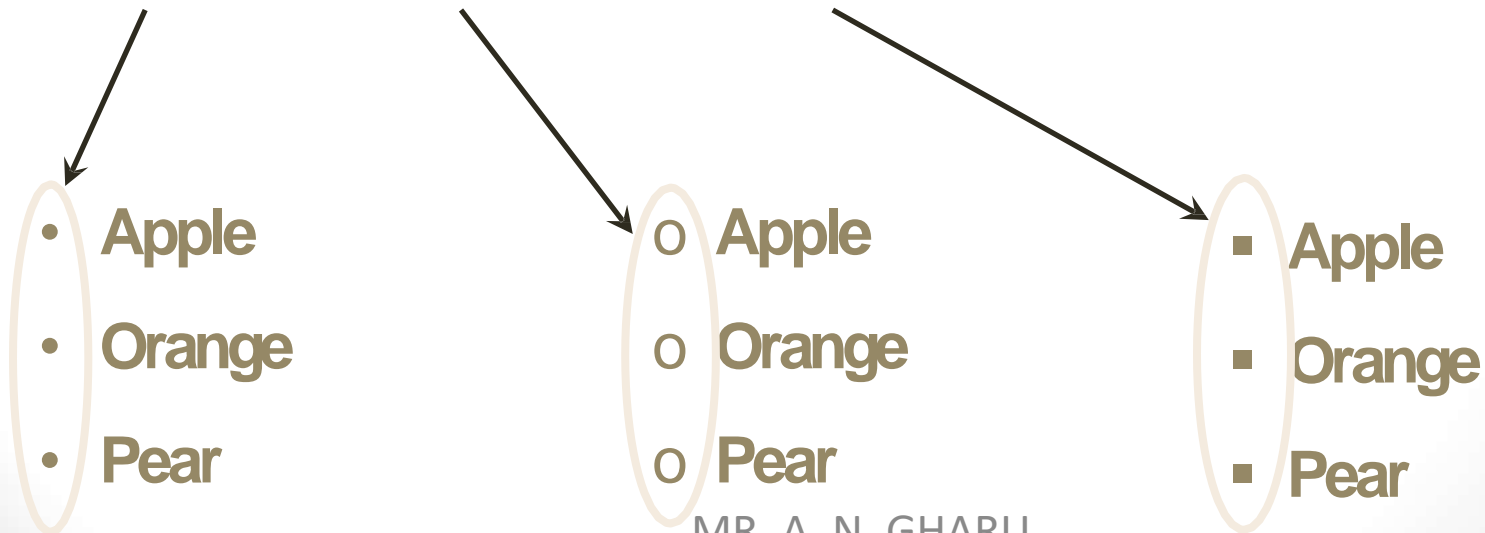

Unordered Lists: Tag

- Create an **U**nordered **L**ist using :

```
<ul type="disk" >  
  <li>Apple</li>  
  <li>Orange</li>  
  <li>Grapefruit</li>  
</ul>
```

- Attribute values for type are:
 - **disc, circle or square**

Definition lists: <dl> tag

- Create definition lists using <dl>
 - Pairs of text and associated definition; text is in <dt> tag, definition in <dd> tag

```
<dl>  
  <dt>HTML</dt>  
  <dd>A markup language ...</dd>  
  <dt>CSS</dt>  
  <dd>Language used to ...</dd>  
</dl>
```

- Renders without bullets
- Definition is indented

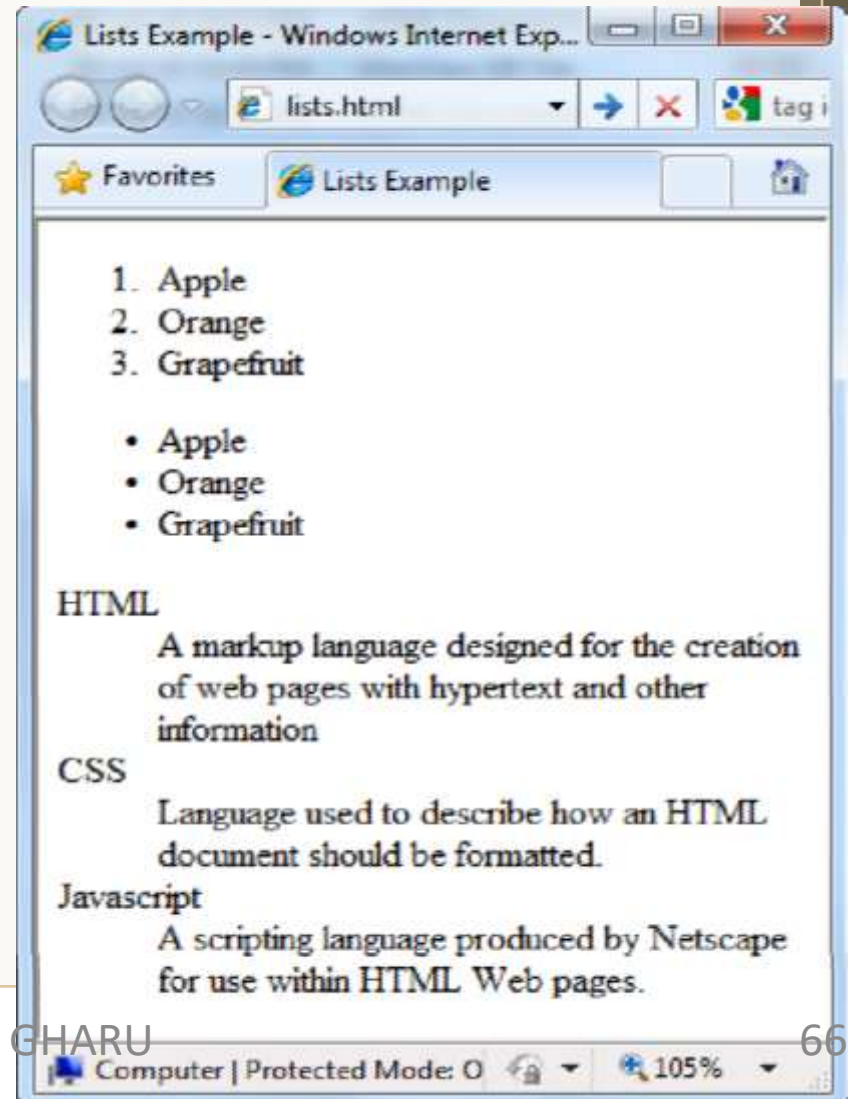

Lists - Example

lists.html

```
<ol type="1">
  <li>Apple</li>
  <li>Orange</li>
  <li>Grapefruit</li>
</ol>

<ul type="disc">
  <li>Apple</li>
  <li>Orange</li>
  <li>Grapefruit</li>
</ul>

<dl>
  <dt>HTML</dt>
  <dd>A markup lang...</dd>
</dl>
```

Data	Data	Data	Data	Data	Data
Data	Data	Data	Data	Data	Data
Data	Data	Data	Data	Data	Data

HTML Table Tags

Tag	Description
<u><table></u>	Defines a table
<u><th></u>	Defines a header cell in a table
<u><tr></u>	Defines a row in a table
<u><td></u>	Defines a cell in a table
<u><caption></u>	Defines a table caption
<u><colgroup></u>	Specifies a group of one or more columns in a table for formatting
<u><col></u>	Specifies column properties for each column within a <colgroup> element
<u><thead></u>	Groups the header content in a table
<u><tbody></u>	Groups the body content in a table
<u><tfoot></u>	Groups the footer content in a table

HTML Table Structure

HTML Tables (2)

- Start and end of a table

```
<table> ... </table>
```

- Start and end of a row

```
<tr> ... </tr>
```

- Start and end of a cell in a row

```
<td> ... </td>
```

Simple HTML Tables - Example

```
<html>
<body>

<table width=100% border = "1" bgcolor = "yellow">
  <tr>
    <th>Firstname</th>
    <th>Lastname</th>
    <th>Age</th>
  </tr>
  <tr>
    <td>Jill</td>
    <td>Smith</td>
    <td>50</td>
  </tr>
</table>

</body>
</html>
```

Firstname	Lastname	Age
Jill	Smith	50

Simple HTML Tables - Example

```
<html>
<body>

<table width=50% border = "1" >
  <tr>
    <th colspan=2>Firstname</th>
    <th>Age</th>
  </tr>
  <tr>
    <td>Jill</td>
    <td>Smith</td>
    <td>50</td>
  </tr>
</table>

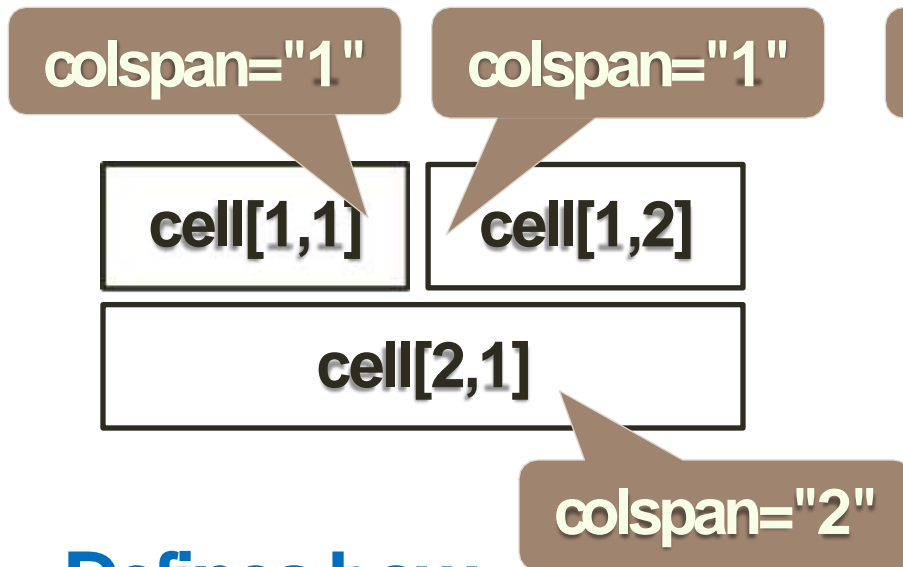

</body>
</html>
```

Firstname		Age
Jill	Smith	50

Column and Row Span

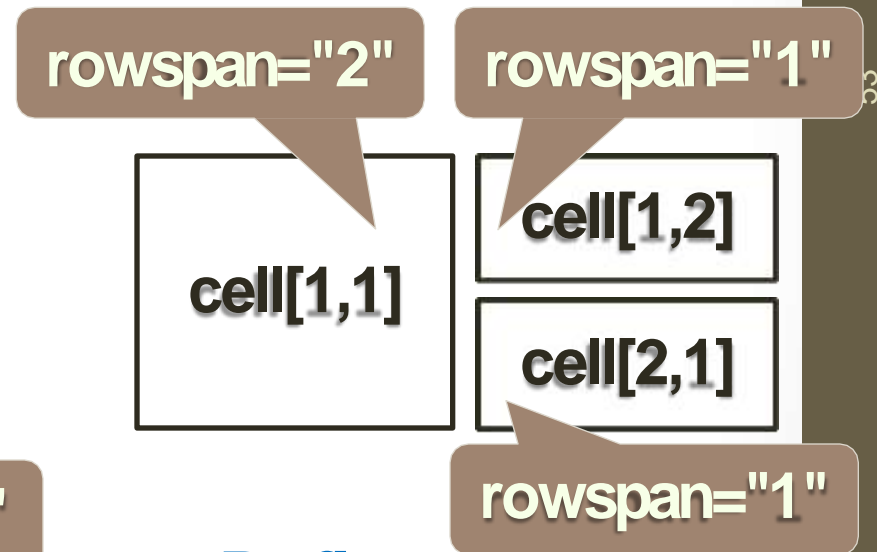

- Table cells have two important attributes:

◆ colspan

- ◆ Defines how many columns the cell occupies

◆ rowspan

- ◆ Defines how many rows the cell occupies

HTML Tables - colspan Example

```
<html>
<body>

<table width=50% border = "1" >
  <tr>
    <th colspan=2>Firstname</th>
    <th>Age</th>
  </tr>
  <tr>
    <td>Jill</td>
    <td>Smith</td>
    <td>50</td>
  </tr>
</table>

</body>
</html>
```

Firstname		Age
Jill	Smith	50

HTML Tables - rowspan Example

```
<h2 align=center> Cell that spans two rows: </h2>
<table style="width:50%" border="1" align=center>
<tr>
<th>Name:</th>
<td>Bill Gates</td>
</tr>
<tr>
<th rowspan="2">Telephone:</th>
<td>55577854</td>
</tr>
<tr>
<td>55577855</td>
</tr>
</table>

</body>
</html>
```

Cell that spans two rows:

Name:	Bill Gates
Telephone:	55577854
	55577855

HTML Tables - rowspan

Example with <style>

```
<html>
<head>
<style>
th, td {
padding: 5px;
text-align: left;
}
</style>
</head>
<body>
```

Cell that spans two rows:

Name:	Bill Gates
Telephone:	55577854
	55577855

```
<h2>Cell that spans two rows:</h2>
<table style="width:50%" border=1>
  <tr>
    <th>Name:</th>
    <td>Bill Gates</td>
  </tr>
  <tr>
    <th rowspan="2">Telephone:</th>
    <td>55577854</td>
  </tr>
  <tr>
    <td>55577855</td>
  </tr>
</table>

</body>
</html>
```

Complete HTML Tables

- Table rows split into three semantic sections: header, body and footer
 - `<thead>` denotes table header and contains `<th>` elements, instead of `<td>` elements
 - `<tbody>` denotes collection of table rows that contain the very data
 - `<tfoot>` denotes table footer but comes BEFORE the `<tbody>` tag
 - `<colgroup>` and `<col>` define columns (most often used to set column widths)

Div and Span Tags

Span and Div tag- Value Addition

- The `` tag is an inline container **used to mark up a part of a text, or a part of a document.**
- The `` tag is much like the `<div>` element, but **`<div>` is a block-level element** and `` is an inline element.

Span and Div tag- Value Addition

```
<html>
<body>
My mother has <span
style="color:blue"> blue
</span> eyes and my father
has <span
style="color:green">dark
green</span> eyes.
</body>
</html>
```

```
<html>
<body>
My mother has <div
style="color:blue"> blue
</div> eyes and my father has
<div style= "color:green">
dark green</div> eyes.
</body>
</html>
```

HTML FORMS

HTML Forms

Entering User Data from a Web Page

HTML Form

- **The <form> Element**
- The HTML **<form>** element defines a form that is used to collect user input:
- **Syntax**
 - `<form>`
 - form elements*
 - `</form>`
- Form elements are different types of input elements, like
 - text fields,
 - checkboxes,
 - radio buttons,
 - submit buttons, and more.

The <input> Element

- The **<input>** element is the most important form element.
- Here are some examples:
 - **Input Type Text**
 - **Input Type Password**
 - **Input Type Submit**
 - **Input Type Radio**
 - **Input Type Reset**
 - **Input Type Checkbox**
 - **Input Type Button ...etc**

- **HTML5 Input Types**
- HTML5 added several new input types
 - color
 - date
 - datetime-local
 - email
 - month
 - number
 - range
 - search
 - tel
 - time
 - url
 - week

Input Type Text

- `<input type="text">` defines a **one-line text input field**:
- Example
- This is how the HTML code above will be displayed in a browser:

```
<form>  
  First name:<br>  
  <input type="text" name="firstname"><br>  
  Last name:<br>  
  <input type="text" name="lastname">  
</form>
```

First name:

Last name:

Input Type Password

- `<input type="password">`
- defines a **password field**:
- Example
- This is how the HTML code above will be displayed in a browser:

```
<form>  
  User name:<br>  
  <input type="text" name="username"><br>  
  User password:<br>  
  <input type="password" name="psw">  
</form>
```

User name:

User password:

The characters in a password field are masked (shown as asterisks or circles).

Input Type Submit

- defines a button for **submitting** form data to a **form-handler**.
- The form-handler is specified in the form's **action** attribute:
- **Example**

```
<form action="/action_page.php">
```

```
  First name:<br>
```

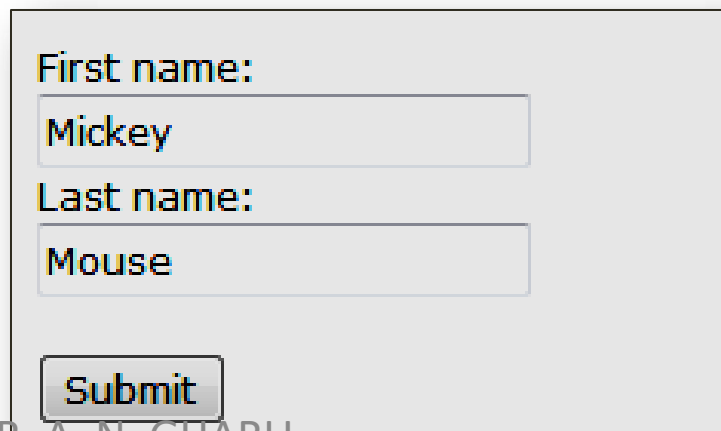

```
  <input type="text" name="firstname" value="Mickey"> <br>
```

```
  Last name:<br>
```

```
  <input type="text" name="lastname" value="Mouse"><br><br>
```

```
  <input type="submit" value="Submit">
```

```
</form>
```

First name:
Mickey

Last name:
Mouse

Submit

Input Type Reset

- `<input type="reset">` defines a **reset button** that will reset all form values to their default values:
- **click the "Reset" button, the form-data will be reset.**
- **Example**

```
<form action="/action_page.php">  
First name:<br>  
<input type="text" name="firstname" >  
<br>  
Last name:<br>  
<input type="text" name="lastname" >  
<br><br>  
<input type="submit" value="Submit">  
<input type="reset">  
</form>
```

First name:

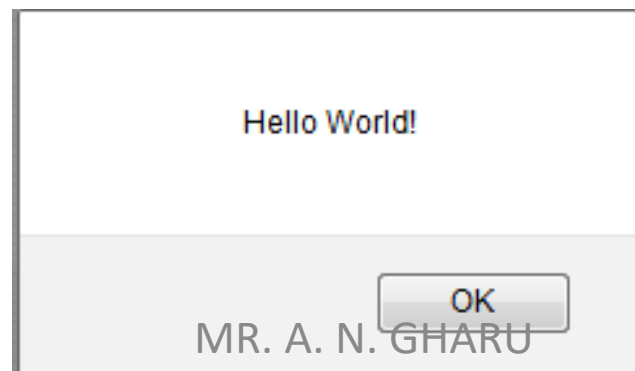

Last name:

Input Type Button

- `<input type="button">` defines a **button**:
- **Example**
- `<input type="button" onclick="alert('Hello World!')" value="Click Me!">`

- After clicking above button it shows output as below:

Input Type Radio

- `<input type="radio">` defines a **radio button**.
- Radio buttons let a user select **ONLYONE** of a limited number of choices:
- `<form>`
 - `<input type="radio" name="gender" value="male" checked>Male
`
 - `<input type="radio" name="gender" value="female">Female
`
 - `<input type="radio" name="gender" value="other">Other``</form>`
- This is how the HTML code above will be displayed in a browser:

Male
 Female
 Other

Input Type Checkbox

- `<input type="checkbox">` defines a **checkbox**.
- Checkboxes let a user select **ZERO** or **MORE** options of a limited number of choices.
- **Example**

```
<form>
```

```
<input type="checkbox" name="vehicle1" value="Bike"> I have a bike
```

```
<br>
```

```
<input type="checkbox" name="vehicle2" value="Car"> I have a car
```

```
</form>
```

- This is how the HTML code above will be displayed in a browser:

I have a bike

I have a car

HTML Input Attributes

- The value Attribute
- The readonly Attribute
- The disabled Attribute
- The size Attribute
- The maxlength Attribute

The <select> Element (Dropdown menus)

- The <select> element defines a **drop-down list**:
- `<select name="cars">`
 - `<option value="volvo">Volvo</option>`
 - `<option value="saab">Saab</option>`
 - `<option value="fiat">Fiat</option>`
 - `<option value="audi">Audi</option>`
- `</select>`

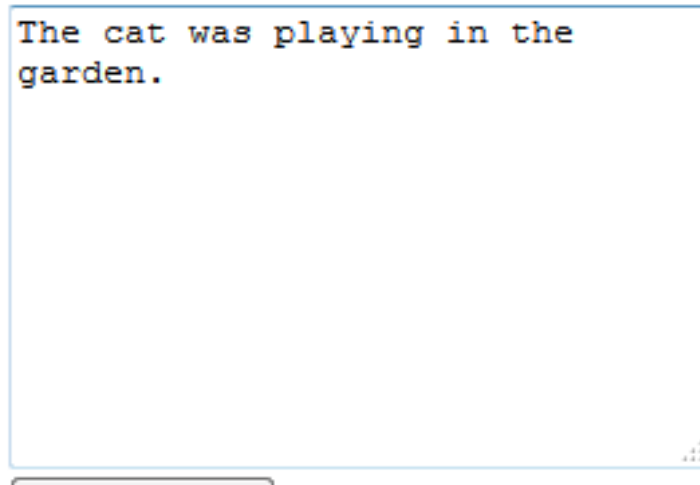

The <select> Element with multiple selection

- `<select name="cars" size="4" multiple>`
 `<option value="volvo">Volvo</option>`
 `<option value="saab">Saab</option>`
 `<option value="fiat">Fiat</option>`
 `<option value="audi">Audi</option>`
 `</select>`

The <textarea> Element

- `<textarea name="message" rows="10" cols="30">`
The cat was playing in the garden.
`</textarea>`

- The **rows** attribute specifies the visible number of lines in a text area.
- The **cols** attribute specifies the visible width of a text area.

HTML Forms - Example

form.html

```
<form method="post" action="apply-now.php">
  <input name="subject" type="hidden" value="Class" />
  <fieldset><legend>Academic information</legend>
    <label for="degree">Degree</label>
    <select name="degree" id="degree">
      <option value="BA">Bachelor of Art</option>
      <option value="BS">Bachelor of Science</option>
      <option value="MBA" selected="selected">Master of
        Business Administration</option>
    </select>
    <br />
    <label for="studentid">Student ID</label>
    <input type="password" name="studentid" />
  </fieldset>
  <fieldset><legend>Personal Details</legend>
    <label for="fname">First Name</label>
    <input type="text" name="fname" id="fname" />
    <br />
    <label for="lname">Last Name</label>
    <input type="text" name="lname" id="lname" />
```

HTML Forms - Example (2)

form.html (continued)

```
<br />
  Gender:
  <input name="gender" type="radio" id="gm" value="m" />
  <label for="gm">Male</label>
  <input name="gender" type="radio" id="gf" value="f" />
  <label for="gf">Female</label>
<br />
  <label for="email">Email</label>
  <input type="text" name="email" id="email" />
</fieldset>
<p>
  <textarea name="terms" cols="30" rows="4"
    readonly="readonly">TERMS ANDCONDITIONS...</textarea>
</p>
<p>
  <input type="submit" name="submit" value="Send Form" />
  <input type="reset" value="Clear Form" />
</p>
</form>
```

HTML FRAME

HTML Frames

`<frameset>`, `<frame>` and `<iframe>`

HTML Frames

- Frames provide a way to show multiple HTML documents in a single Web page
- The page can be split into separate views (frames) horizontally and vertically
- Frames were popular in the early ages of HTML development, but now their usage is rejected
- Frames are not supported by all user agents (browsers, search engines, etc.)
 - A `<noframes>` element is used to provide content for non-compatible agents.

HTML <frame> Tag.

- **Example**
- A simple three-framed page:
- ```
<frameset cols="25%,50%,25%">
 <frame src="frame_a.htm">
 <frame src="frame_b.htm">
 <frame src="frame_c.htm">
</frameset>
```

- Each <frame> in a <frameset> can have different attributes, such as border, scrolling, the ability to resize, etc.

# Outline

<ul style="list-style-type: none"> <li>Works with all old browsers</li> </ul>	<ul style="list-style-type: none"> <li>Supported by all new browser.</li> </ul>

# HTML VERSUS HTML5

## HTML

No standardized process to handle structurally incorrect HTML codes.

It's not mobile friendly.

No audio and video support in HTML.

It does not support all major web browsers.

Vector Graphics is possible when used in conjunction with Flash, Silverlight, or similar third-party plugins.

It does not allow JavaScript to run in browser.

## HTML5

It supports persistent error handling via improvised error handling process.

It's mobile friendly.

Audio/video elements can be integrated directly onto a web page.

It is supported by all major web browsers.

Scalable Vector Graphics (SVG) is an integral part of the HTML5 language specification.

It allows JavaScript to run in background.

# CASCADING STYLE SHEET

# Cascading Style Sheets (CSS)

---

```
171 #content .article img.left.border {
172 padding: 0 9px 9px 0;
173 border-right: 1px dotted #999;
174 border-bottom: 1px dotted #999; }
175 #content .article blockquote {
176 margin-left: 10px;
177 padding-left: 10px;
178 border-left: 3px solid #252525; }
179 #content .article ul {
180 padding-left: 1em;
181 list-style-type: circle; }
```

# Introduction of CSS

- Cascading Style Sheets, fondly referred to as CSS, is a simple design language intended to simplify the process of making web pages presentable.
- CSS handles the look and feel part of a web page.
- Using CSS, you can control the color of the text, the style of fonts, the spacing between paragraphs, how columns are sized and laid out, what background images or colors are used, layout designs, variations in display for different devices and screen sizes as well as a variety of other effects.

# Advantages of CSS

- CSS saves time
- Pages load faster
- Easy maintenance
- Superior styles to HTML
- Multiple Device Compatibility
- Global web standards
- Offline Browsing
- Platform Independence

# CSS3 Modules

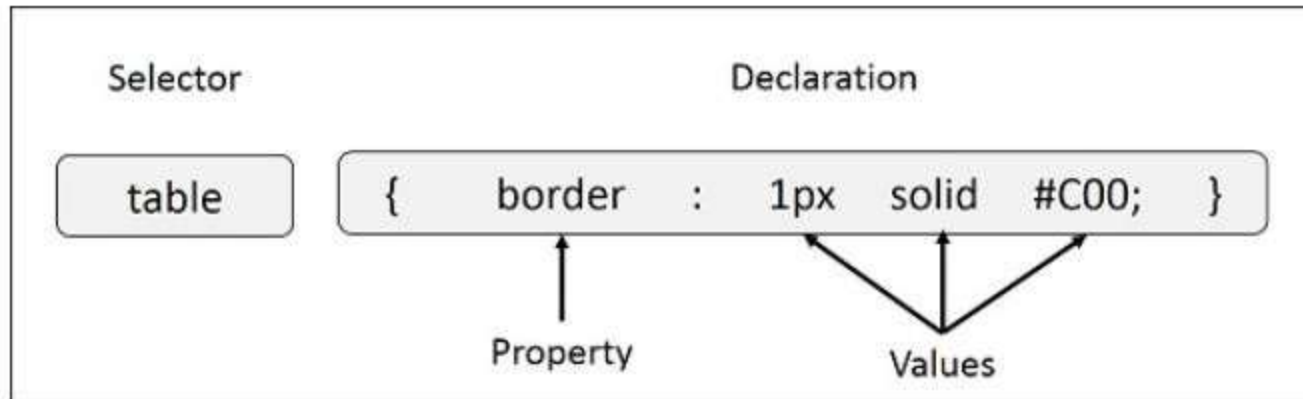

- Selectors
- Box Model
- Backgrounds and Borders
- Image Values and Replaced Content
- Text Effects
- 2D/3D Transformations
- Animations
- Multiple Column Layout
- User Interface

# CSS - Syntax

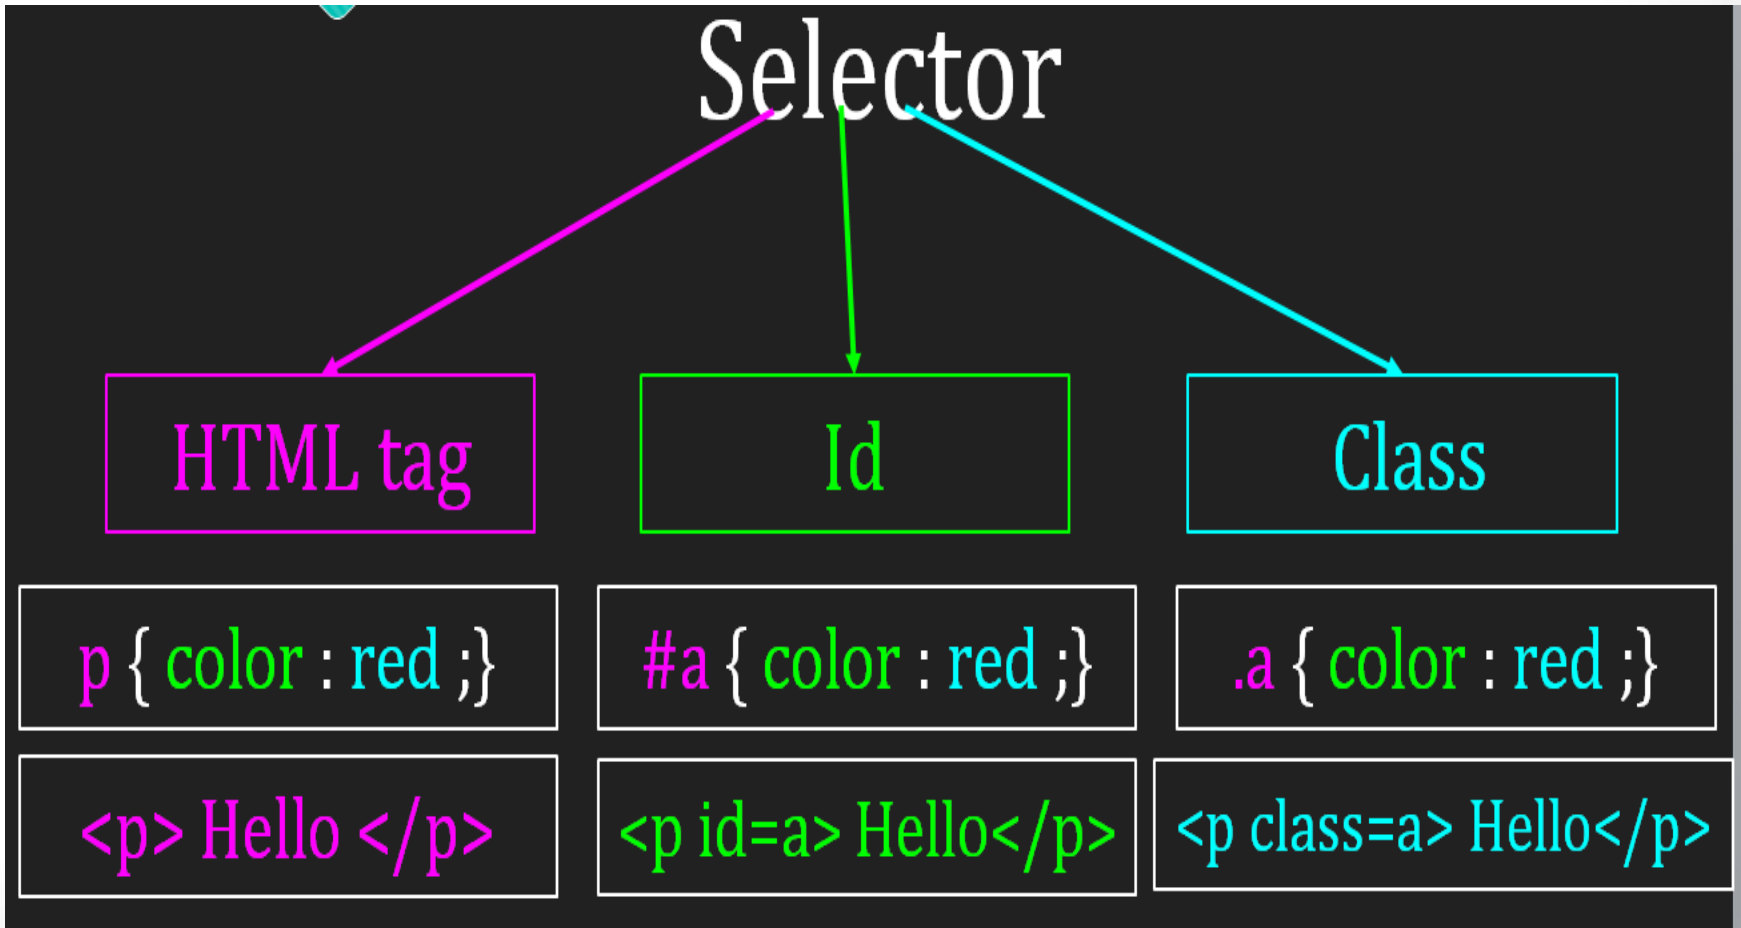

- A CSS comprises of style rules that are interpreted by the browser and then applied to the corresponding elements in your document.
- Style rule is made of three parts –
- **Selector** – A selector is an HTML tag at which a style will be applied. This could be any tag like `<h1>` or `<table>` etc.
- **Property** - A property is a type of attribute of HTML tag. Put simply, all the HTML attributes are converted into CSS properties. They could be *color*, *border* etc.
- **Value** - Values are assigned to properties. For example, *color* property can have value either *red* or *#F1F1F1* etc.

# CSS - Syntax

- Syntax:
- selector { property: value }
- Example:
- `table{ border :1px solid #C00; }`

# CSS - Syntax

# CSS - Syntax

## Selector

HTML tag

```
p { color : red ;}
```

```
<p> Hello </p>
```

Id

```
#a { color : red ;}
```

```
<p id=a> Hello</p>
```

Class

```
.a { color : red ;}
```

```
<p class=a> Hello</p>
```

# CSS selectors (1)

- CSS selectors are used to "find" (or select) HTML elements based on their element name, id, class, attribute, and more.
- **The element Selector**
  - The element selector selects elements based on the element name.
  - You can select all <p> elements on a page like this (in this case, all <p> elements will be center-aligned, with a red text color):
  - **Example**
    - ```
p {  
    text-align: center;  
    color: red;  
}
```

Example with output

HTML Code with CSS

```
<html>
<head>
<style>
p {
  text-align: center;
  color: red;
}
</style>
</head>
<body>

<p>Every paragraph will be affected by the style.</p>
<p id="para1">Me too!</p>
<p>And me!</p>

</body>
</html>
```

Output

Every paragraph will be affected by the style.

Me too!

And me!

CSS selectors (2)

- **The id Selector**
- The id selector uses the id attribute of an HTML element to select a specific element.
- The id of an element should be unique within a page, so the id selector is used to select one unique element!
- To select an element with a specific id, write a hash (#) character, followed by the id of the element.
- The style rule below will be applied to the HTML element with `id="para1"`:
- **Example**
- ```
#para1 {
 text-align: center; color: red;
}
```

# Example with output

```
<!DOCTYPE html>
<html>
<head>
<style>
#para1 {
 text-align: center;
 color: red;
}
</style>
</head>
<body>

<p id="para1">Hello World!</p>
<p>This paragraph is not affected by the style.</p>

</body>
</html>
```

HTML Code with CSS

Hello World!

This paragraph is not affected by the style.

Output

# CSS selectors (3)

- **The class Selector**
- The class selector selects elements with a specific class attribute.
- To select elements with a specific class, write a period (.) character, followed by the name of the class.
- In the example below, all HTML elements with class="center" will be red and center-aligned:
- **Example**
- ```
.center {  
    text-align: center;  
    color: red;  
}
```

Example with output

HTML Code with CSS

```
<!DOCTYPE html>
<html>
<head>
<style>
.center {
  text-align: center;
  color: red;
}
</style>
</head>
<body>

<h1 class="center">Red and center-aligned heading</h1>
<p class="center">Red and center-aligned paragraph.</p>

</body>
</html>
```

Output

Red and center-aligned heading

Red and center-aligned paragraph.

MR. A. N. GHARU

CSS selectors (4)

- **The class Selector continued...**
- You can also specify that only specific HTML elements should be affected by a class.
- In the example below, only `<p>` elements with `class="center"` will be center-aligned:
- **Example**
- ```
p.center {
 text-align: center; color: red;
}
```

# CSS selectors(Inheritance)

- **Grouping Selectors**

- If you have elements with the same style definitions, like this:

- ```
h1 {  
    text-align: center;  
    color: red;}
```

```
h2 {  
    text-align: center;  
    color: red; }
```

```
p {  
    text-align: center;  
    color: red;}
```

- It will be better to group the selectors, to minimize the code.

- ```
h1, h2, p {
 text-align: center;
 color: red;
}
```

# Example with output

## HTML Code with CSS

```
<!DOCTYPE html>
<html>
<head>
<style>
h1, h2, p {
 text-align: center;
 color: red;
}
</style>
</head>
<body>

<h1>Hello World!</h1>
<h2>Smaller heading!</h2>
<p>This is a paragraph.</p>

</body>
</html>
```

## Output

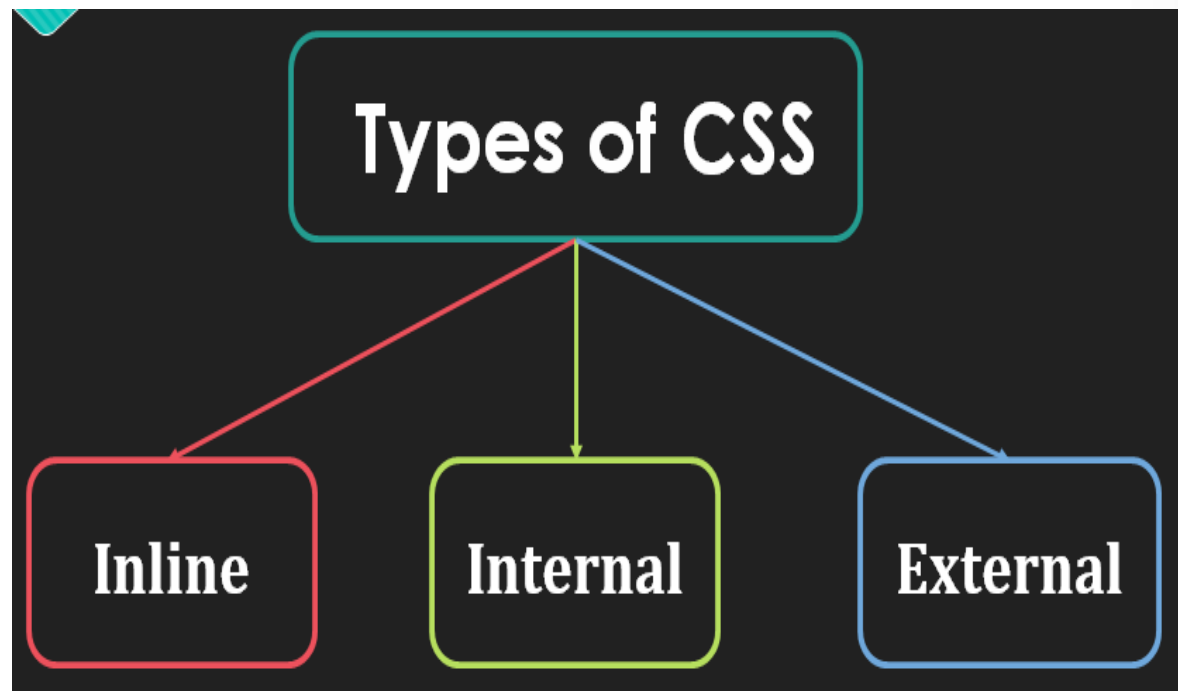

**Hello World!**

**Smaller heading!**

This is a paragraph.

# Insert CSS in HTML

- **Three Ways to Insert CSS**
  1. External style sheet
  2. Internal style sheet
  3. Inline style

# External Style Sheet

- With an external style sheet, you can change the look of an entire website by changing just one file!
- Each page must include a reference to the external style sheet file inside the `<link>` element. The `<link>` element goes inside the `<head>` section:

- **Example**

- `<head>`

```
<link rel="stylesheet" type="text/css" href="mystyle.css">
```

```
</head>
```

# External Style Sheet - Example

## HTML Code

```
<html>
<head>
<link rel="stylesheet" type="text/css" href="mystyle.css">
</head>
<body>

<h1>This is a heading</h1>
<p>This is a paragraph.</p>

</body>
</html>
```

## CSSFile named- mystyle.css

```
body {
 background-color: lightblue;
}

h1 {
 color: navy;
 margin-left: 20px;
}
```

# Internal Style Sheet

- An internal style sheet may be used if one single page has a unique style.
- Internal styles are defined within the <style> element, inside the <head> section of an HTML page:
- **Example**

```
<head>
<style>
body {
 background-color: linen;
}

h1 {
 color: maroon;
 margin-left: 40px;
}
</style>
</head>
```

# Inline Styles

- An inline style may be used to apply a unique style for a single element.
- To use inline styles, add the style attribute to the relevant element. The style attribute can contain any CSS property.
- The example below shows how to change the color and the left margin of a `<h1>` element:

- **Example**

```
<!DOCTYPE html>
<html>
<body>

<h1 style="color:blue;margin-left:30px;">This is a heading</h1>
<p>This is a paragraph.</p>

</body>
</html>
```

# When to use any CSS?

## Types of CSS

```
graph TD; A[Types of CSS] --> B[Inline]; A --> C[Internal]; A --> D[External]; B --> E[When you want to use css property for only one tag in html]; C --> F[When you want to use css property for more than one tag and you have only one html file.]; D --> G[When your website is having multiple html files and you want same style to be applied for every html page];
```

**Inline**

When you want to use css property for only one tag in html

**Internal**

When you want to use css property for more than one tag and you have only one html file.

**External**

When your website is having multiple html files and you want same style to be applied for every html page

# **Text Related CSS Properties**

# Text-related CSS Properties

- **color** – specifies the color of the text
- **font-size** – size of font: **xx-small**, **x-small**, **small**, **medium**, **large**, **x-large**, **xx-large**, **smaller**, **larger** or numeric value
- **font-family** – comma separated font names
  - Example: **verdana**, **sans-serif**, etc.
  - The browser loads the first one that is available
  - There should always be at least one generic font
- **font-weight** can be **normal**, **bold**, **bolder**, **lighter** or a number in range [100 ... 900]

# CSS Rules for Fonts (2)

- **font-style** – styles the font
  - Values: **normal, italic, oblique**
- **text-decoration** – decorates the text
  - Values: **none, underline, line-through, overline, blink**
- **text-align** – defines the alignment of text or other content
  - Values: **left, right, center, justify**

# Shorthand Font Property

- **font**
  - Shorthand rule for setting multiple font properties at the same time

```
font:italic normal bold 12px/16px verdana
```

is equal to writing this:

```
font-style:italic;
font-variant:normal;
font-weight:bold;
font-size: 12px;
line-height:16px;
font-family:verdana;
```

# Backgrounds

- background-image
  - URL of image to be used as background, e.g.:

**background-image:url("back.gif");**

```
background-image:url("back.gif");
```

- background-color
  - Using color and image and the same time
- background-repeat
  - repeat-x, repeat-y, repeat, no-repeat
- background-attachment
  - fixed / scroll

# Backgrounds (2)

- background-position: specifies vertical and horizontal position of the background image
  - Vertical position: top, center, bottom
  - Horizontal position: left, center, right
  - Both can be specified in percentage or other numerical values
  - Examples:

```
background-position: top left;
```

```
background-position: -5px 50%;
```

# Borders

- border-width: thin, medium, thick or numerical value (e.g. 10px)
- border-color: color alias or RGB value
- border-style: none, hidden, dotted, dashed, solid, double, groove, ridge, inset, outset
- Each property can be defined separately for left, top, bottom and right
  - border-top-style, border-left-color, ...

# Border Shorthand Property

- border: shorthand rule for setting border properties at once:

```
border: 1px solid red
```

is equal to writing:

```
border-width:1px;
border-color:red;
border-style:solid;
```

- Specify different borders for the sides via shorthand rules: border-top, border-left, border-right, border-bottom
- When to avoid border:0

# Width and Height

- width – defines numerical value for the width of element, e.g. 200px
- height – defines numerical value for the height of element, e.g. 100px
  - By default the height of an element is defined by its content
  - Inline elements do not apply height, unless you change their **display** style.

# Outline

Introduction to web technology, internet and www, Web site planning and design issues,

HTML: structure of html document,HTML elements:headings, paragraphs, line break, colors & fonts, links, frames, lists, tables, images and forms,

Difference between HTML and HTML5.

CSS:Introduction to Style Sheet,Inserting CSS in an HTML page, CSS selectors,

XML: Introduction to XML, XML key component, Transforming XML into XSLT,

DTD: Schema, elements, attributes,

Introduction to JSON.

**XML**

# XML

- **Introduction to XML**

- XML is a software- and hardware-independent tool for storing and transporting data.

- **What is XML?**

- XML stands for eXtensible Markup Language
- XML is a markup language much like HTML
- XML was designed to store and transport data
- XML was designed to be self-descriptive
- XML is a W3C Recommendation

# XML Does Not DO Anything

- This note is a note to Tove from Jani, stored as XML::
- ```
<note>  
  <to>Tove</to>  
  <from>Jani</from>  
  <heading>Reminder</heading>  
  <body>Don't forget me this weekend!</body>  
</note>
```
- The XML above is quite self-descriptive:
 - It has sender information.
 - It has receiver information
 - It has a heading
 - It has a message body.
- But still, the XML above does not DO anything. XML is just information wrapped in tags.

The Difference Between XML and HTML

- XML and HTML were designed with different goals:
- XML was designed to carry data - with focus on what data is
- HTML was designed to display data - with focus on how data looks
- XML Does Not Use Predefined Tags like HTML tags

XML Used For(1)

- It simplifies data sharing
- It simplifies data transport
- It simplifies platform changes
- It simplifies data availability

XML Used For(2)

- Many computer systems contain data in incompatible formats. Exchanging data between incompatible systems (or upgraded systems) is a time-consuming task for web developers. Large amounts of data must be converted, and incompatible data is often lost.
- XML stores data in plain text format. This provides a software- and hardware-independent way of storing, transporting, and sharing data.
- XML also makes it easier to expand or upgrade to new operating systems, new applications, or new browsers, without losing data.

XML Example 1

- `<?xml version="1.0" encoding="UTF-8"?>`
`<note>`
 `<to>Amit</to>`
 `<from>Neha</from>`
 `<heading>Reminder</heading>`
 `<body>Don't forget me this weekend!</body>`
`</note>`
- Save the file with .xml extension and when run o/p is like below

```
<note>
  <to>Tove</to>
  <from>Jani</from>
  <heading>Reminder</heading>
  <body>Don't forget me this weekend!</body>
</note>
```

XML Example 2- Books.xml

- `<?xml version="1.0" encoding="UTF-8"?>`

```
<bookstore>
```

```
  <book category="children">
```

```
    <title lang="en">Harry Potter</title>
```

```
    <author>J K. Rowling</author>
```

```
    <year>2005</year>
```

```
    <price>29.99</price>
```

```
  </book>
```

```
  <book category="web" cover="paperback">
```

```
    <title lang="en">Learning XML</title>
```

```
    <author>Erik T. Ray</author>
```

```
    <year>2003</year>
```

```
    <price>39.95</price>
```

```
  </book>
```

```
</bookstore>
```

XML Example 2- Books.xml

explanation

- XML uses a much self-describing syntax.
- A prolog defines the XML version and the character encoding:
 - `<?xml version="1.0" encoding="UTF-8"?>`
- The next line is the **root element** of the document:
 - `<bookstore>`
- The next line starts a `<book>` element:
 - `<book category="cooking">`
- The `<book>` elements have **4 child elements**: `<title>`, `<author>`, `<year>`, `<price>`.
- The next line ends the book element:
 - `</book>`

XSLT

- XSLT(eXtensible Stylesheet Language Transformations) is the recommended style sheet language for XML.
- XSLT is far more sophisticated than CSS.
- With XSLT you can add/remove elements and attributes to or from the output file.
- You can also rearrange and sort elements, perform tests and make decisions about which elements to hide and display, and a lot more.
- XSLT uses XPath to find information in an XML document.

Displaying XML with XSLT

Create XML Page

Create XSLTPage according to your design criteria

Link XML page with XSLTPage

Get output on browser

Step 1 : Create XMLDocument: students.xml

```
<?xml version = "1.0"?>
```

```
<class>
```

```
  <student rollno = "393">
```

```
    <firstname>Dinkar</firstname>
```

```
    <lastname>Kad</lastname>
```

```
  </student>
```

```
  <student rollno = "493">
```

```
    <firstname>Vaneet</firstname>
```

```
    <lastname>Gupta</lastname>
```

```
  </student>
```

```
</class>
```

Step 2: XSLT Conversion criteria

- We need to define an XSLT style sheet document for the above XML document to meet the following criteria –
- Page should have a title **Students**.
- Page should have a table of student details.
- Columns should have following headers:
 - Roll No, First Name, Last Name
- Table must contain details of the students accordingly.

Step 2: Create XSLT document

according to design criteria: students.xsl

```
<?xml version = "1.0" encoding = "UTF-8"?>
<xsl:stylesheet version = "1.0" xmlns:xsl = "http://www.w3.org/1999/XSL/Transform">
  <xsl:template match = "/">
    <html> <body>
      <h2>Students</h2>

      <table border = "1">
        <tr bgcolor = "#9acd32">
          <th>Roll No</th>
          <th>First Name</th>
          <th>Last Name</th>
        </tr>

        <xsl:for-each select="class/student">
          <tr>
            <td><xsl:value-of select = "@rollno"/></td>
            <td><xsl:value-of select = "firstname"/></td>
            <td><xsl:value-of select = "lastname"/></td>
          </tr>
        </xsl:for-each> </table>
      </body> </html>
    </xsl:template>
  </xsl:stylesheet>
```

Step 3: Link the XSLT Document to the XML Document (.xml file)

- `<?xml version = "1.0"?>`
- `<?xml-stylesheet type = "text/xsl" href = "students.xsl"?>`
- `<class>`
 - `<student rollno = "393">`
 - `<firstname>Dinkar</firstname>`
 - `<lastname>Kad</lastname>`
 - `</student>`
 - `<student rollno = "493">`
 - `<firstname>Vaneet</firstname>`
 - `<lastname>Gupta</lastname>`
 - `</student>`
- `</class>`

Step 4: View the XML Document in Internet Explorer

```
<?xml version = "1.0"?>
```

```
<?xml-stylesheet type = "text/xsl" href = "students.xsl"?>
```

```
<class>
```

```
  <student rollno = "393">
```

```
    <firstname>Dinkar</firstname>
```

```
    <lastname>Kad</lastname>
```

```
</student>
```

```
  <student rollno = "493">
```

```
    <firstname>Vaneet</firstname>
```

```
    <lastname>Gupta</lastname>
```

```
</student>
```

```
</class>
```

Output

Students

Roll No	First Name	Last Name
393	Dinkar	Kad
493	Vaneet	Gupta

DTD

Introduction to DTD

- A DTD is a Document Type Definition.
- A DTD defines the structure and the legal elements and attributes of an XML document.
- With a DTD, independent groups of people can agree on a standard DTD for interchanging data.
- An application can use a DTD to verify that XML data is valid.

An Internal DTD Example

- `<?xml version="1.0"?>`

```
<!DOCTYPEnote [
```

```
<!ELEMENT note (to,from,heading,body)>
```

```
<!ELEMENT to (#PCDATA)>
```

```
<!ELEMENT from (#PCDATA)>
```

```
<!ELEMENT heading (#PCDATA)>
```

```
<!ELEMENT body (#PCDATA)>
```

```
]>
```

```
<note>
```

```
<to>Tove</to>
```

```
<from>Jani</from>
```

```
<heading>Reminder</heading>
```

```
<body>Don't forget me this weekend</body>
```

```
</note>
```

An Internal DTD Expalnation

- The DTD in previous slide is interpreted like this:
- **!DOCTYPE**note defines that the root element of this document is note
- **!ELEMENT**note defines that the note element must contain four elements: "to,from,heading,body"
- **!ELEMENT**to defines the to element to be of type "#PCDATA"
- **!ELEMENT**from defines the from element to be of type "#PCDATA"
- **!ELEMENT**heading defines the heading element to be of type "#PCDATA"
- **!ELEMENT**body defines the body element to be of type "#PCDATA"

An External DTD Example

- XML File

- `<?xml version="1.0"?>`

- `<!DOCTYPEnote SYSTEM"note.dtd">`

- `<note>`

- `<to>Tove</to>`

- `<from>Jani</from>`

- `<heading>Reminder</heading>`

- `<body>Don't forget me this weekend!</body>`

- `</note>`

- note.dtd

- `<!ELEMENTnote`

- `(to,from,heading,body)>`

- `<!ELEMENTto (#PCDATA)>`

- `<!ELEMENTfrom (#PCDATA)>`

- `<!ELEMENTheading`

- `(#PCDATA)>`

- `<!ELEMENTbody (#PCDATA)>`

Building Blocks of XML Documents as per DTD

- **Elements :** `<body>some text</body>`
- **Attributes :** ``
- **Entities :** `<`; `&`;
- **PCDATA :** PCDATA means parsed character data.
 - **PCDATA is text that WILL be parsed by a parser.**
Character data is the text found between the start tag and the end tag of an XML element.
- **CDATA:** CDATA means character data.
 - **CDATA is text that will NOT be parsed by a parser.**

Elements

- XML elements can be defined as building blocks of an XML document.
- Elements can behave as a container to hold text, elements, attributes, media objects or mix of all.
- Each XML document contains one or more elements, the boundaries of which are either delimited by start-tags and end-tags, or empty elements.
- **Example**
- `<name>Tutorials Point</name>`

Attributes

- Attributes are part of the XML elements.
- An element can have any number of unique attributes.
- Attributes give more information about the XML element or more precisely it defines a property of the element.
- An XML attribute is always a *name-value* pair.

- **Example**
- ``
- Here *img* is the element name whereas *src* is an attribute name and *flower.jpg* is a value given for the attribute *src*.

Entities

- Entities are placeholders in XML. These can be declared in the document prolog or in a DTD. Entities can be primarily categorized as:
 - Built-in entities
 - Character entities
 - General entities
 - Parameter entities
- There are five built-in entities that play in well-formed XML, they are:
 - ampersand: &
 - Single quote: '
 - Greater than: >
 - Less than: <
 - Double quote: "

Advantages & Disadvantages

- **Advantages of using DTD**

- **Documentation** - You can define your own format for the XML files.
- **Validation** - It gives a way to check the validity of XML files by checking whether the elements appear in the right order, mandatory elements and attributes are in place

- **Disadvantages of using DTD**

- It does not support the namespaces.
- It supports only the *text string datatype*.
- It is not object oriented.

BOOTSTRAP

Bootstrap

Bootstrap is the most popular HTML, CSS, and JavaScript framework for developing responsive, mobile-first websites.

Bootstrap History

Bootstrap was developed by Mark Otto and Jacob Thornton at Twitter, and released as an open source product in August 2011 on GitHub.

In June 2014 Bootstrap was the No.1 project on GitHub!

Bootstrap

- **What is Bootstrap?**
- Bootstrap is a free front-end framework for faster and easier web development
- Bootstrap includes HTML and CSS based design templates for typography, forms, buttons, tables, navigation, modals, image carousels and many other, as well as optional JavaScript plugins
- Bootstrap also gives you the ability to easily create responsive designs

Bootstrap

- **What is Responsive Web Design?**
- Responsive web design is about creating web sites which automatically adjust themselves to look good on all devices, from small phones to large desktops.

Bootstrap- Advantages

Easy to use: Anybody with just basic knowledge of HTML and CSS can start using Bootstrap

Responsive features: Bootstrap's responsive CSS adjusts to phones, tablets, and desktops

Mobile-first approach: In Bootstrap 3, mobile-first styles are part of the core framework

Browser compatibility: Bootstrap is compatible with all modern browsers (Chrome, Firefox, Internet Explorer, Safari, and Opera)

Bootstrap

```
<div class="jumbotron text-center">
```

```
<h1>My First Bootstrap Page</h1>
```

```
<p>Resize this responsive page to see the effect!</p>
```

```
</div>
```

```
<div class="container">
```

```
<div class="row">
```

```
<div class="col-sm-4">
```

```
<h3>Column 1</h3>
```

```
<p>Lorem ipsum dolor..</p>
```

```
</div>
```

Bootstrap

```
<div class="col-sm-4">
```

```
  <h3>Column 2</h3>
```

```
  <p>Lorem ipsum dolor..</p>
```

```
</div>
```

```
<div class="col-sm-4">
```

```
  <h3>Column 3</h3>
```

```
  <p>Lorem ipsum dolor..</p>
```

```
</div>
```

```
</div>
```

```
</div>
```

My First Bootstrap Page

MR. A. N. GHARU

Resize this responsive page to see the effect!

Bootstrap

Why Use Bootstrap?

Advantages of Bootstrap:

Easy to use: Anybody with just basic knowledge of HTML and CSS can start using Bootstrap

Responsive features: Bootstrap's responsive CSS adjusts to phones, tablets, and desktops

Mobile-first approach: In Bootstrap 3, mobile-first styles are part of the core framework

Browser compatibility: Bootstrap is compatible with all modern browsers (Chrome, Firefox, Internet Explorer, Edge, Safari, and Opera)

Bootstrap

Bootstrap Versions

This tutorial follows Bootstrap 3, which was released in 2013.

However, we also cover newer versions; Bootstrap 4 (released 2018) and Bootstrap 5 (released 2021).

Bootstrap 5 is the newest version of Bootstrap; with new components, faster stylesheets, more responsiveness etc. It supports the latest, stable releases of all major browsers and platforms.

However, Internet Explorer 11 and down is not supported.

The main differences between Bootstrap 5 and Bootstrap 3 & 4, is that Bootstrap 5 has switched to JavaScript instead of jQuery.

Bootstrap

Where to Get Bootstrap?

There are two ways to start using Bootstrap on your own web site.

You can:

Download Bootstrap from getbootstrap.com

Include Bootstrap from a CDN

Downloading Bootstrap

If you want to download and host Bootstrap yourself, go to getbootstrap.com, and follow the instructions there.

Bootstrap

Bootstrap CDN

If you don't want to download and host Bootstrap yourself, you can include it from a CDN (Content Delivery Network).

MaxCDN provides CDN support for Bootstrap's CSS and JavaScript. You must also include jQuery:

Bootstrap

```
<!-- Latest compiled and minified CSS -->
```

```
<link rel="stylesheet"
```

```
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.4.1/css/bootstrap.min.css">
```

```
<!-- jQuery library -->
```

```
<script
```

```
src="https://ajax.googleapis.com/ajax/libs/jquery/3.6.3/jquery.min.js"></script>
```

```
<!-- Latest compiled JavaScript -->
```

```
<script
```

```
src="https://maxcdn.bootstrapcdn.com/bootstrap/3.4.1/js/bootstrap.min.js"></scrip
```

```
t>
```

Bootstrap

Create First Web Page With Bootstrap

1. Add the HTML5 doctype

Bootstrap uses HTML elements and CSS properties that require the HTML5 doctype.

Always include the HTML5 doctype at the beginning of the page, along with the lang attribute and the correct character set:

```
<!DOCTYPE html>  
<html lang="en">  
  <head>  
    <meta charset="utf-8">  
  </head>  
</html>
```

Bootstrap

Create First Web Page With Bootstrap

2. Bootstrap 3 is mobile-first

Bootstrap 3 is designed to be responsive to mobile devices. Mobile-first styles are part of the core framework.

To ensure proper rendering and touch zooming, add the following `<meta>` tag inside the `<head>` element:

```
<meta name="viewport" content="width=device-width, initial-scale=1">
```

The `width=device-width` part sets the width of the page to follow the screen-width of the device (which will vary depending on the device).

The `initial-scale=1` part sets the initial zoom level when the page is first loaded by the browser.

Bootstrap

Create First Web Page With Bootstrap

3. Containers

Bootstrap also requires a containing element to wrap site contents.

There are two container classes to choose from:

The `.container` class provides a responsive fixed width container

The `.container-fluid` class provides a full width container, spanning the entire width of the viewport

Bootstrap Grid

span 1	span 1	span 1	span 1	span 1	span 1	span 1	span 1	span 1	span 1	span 1	span 1
span 4				span 4				span 4			
span 4				span 8							
span 6						span 6					
span 12											

Bootstrap Grid

- Bootstrap's grid system allows up to 12 columns across the page.
- If you do not want to use all 12 columns individually, you can group the columns together to create wider columns
- Bootstrap's grid system is responsive, and the columns will re-arrange automatically depending on the screen size.

Bootstrap Grid

xs

(for phones -
screens less
than 768px
wide)

sm

(for tablets -
screens
equal to or
greater than
768px wide)

md

(for small
laptops -
screens equal
to or greater
than 992px
wide)

lg

(for laptops
and desktops -
screens equal
to or greater
than 1200px
wide)

Bootstrap Grid

```
<div class="row">
```

```
<div class="col-*-*"></div>
```

```
<div class="col-*-*"></div>
```

```
</div>
```

.col-sm-4

.col-sm-4

```
<div class="row">
```

```
<div class="col-sm-4"></div>
```

```
<div class="col-sm-4"></div>
```

```
<div class="col-sm-4"></div>
```

```
</div>
```

.col-sm-4

Bootstrap- Where to get?

**Where to get Bootstrap?
Two Options**

```
graph TD; A[Where to get Bootstrap? Two Options] --> B[Download Bootstrap from getbootstrap.com]; A --> C[Include Bootstrap from a CDN]
```

Download Bootstrap
from getbootstrap.com

Include Bootstrap
from a CDN

Bootstrap Example :

```
<html>
<head>
  <link rel="stylesheet" href="https://maxcdn.bootstrapcdn.com/bootstrap/3.4.1/css/bootstrap.min.css">
  <script src="https://ajax.googleapis.com/ajax/libs/jquery/3.5.1/jquery.min.js"></script>
  <script src="https://maxcdn.bootstrapcdn.com/bootstrap/3.4.1/js/bootstrap.min.js"></script>
</head>
<body>
  <div class="row">
    <div class="col-sm-4" style="background-color : pink"> Col1 Data </div>
    <div class="col-sm-4" style="background-color : yellow"> Col2 Data </div>
    <div class="col-sm-4" style="background-color : lavender"> Col3 Data </div>
  </div>
</body>
</html>
```

CDN- Mandatory Lines for
Bootstrap in every code

Change value of Col-**-
according to your need
